ABOUT PARADISE SEEDS

Paradise Seeds is a cannabis seed bank based in Amsterdam. Established in 1994, we offer one of the finest cannabis seed collections in the world. Our varieties combine potency with flavor, taste and yield, making Paradise Seeds the choice of connoisseurs around the globe.

We stock a range of cannabis seeds that offer great options for both beginner and professional growers, with strains that are ideal for indoor set ups and outdoor growing conditions all over the world.

In addition to wholesale sales, we retail direct to customers via our website and through the Paradise Seeds store in Amsterdam.

Why choose Paradise Seeds? Because our company ethos has changed very little from the days when we started out on our mission to grow great cannabis! Our early efforts were soon noticed on the Amsterdam coffee shop scene and over the years we have continued to do what we do (and love what we do!).

An impressive collection of awards and cups illustrates the quality of our strains. We work with international partners to build knowledge of the plant, research medical cannabis and spread awareness of this amazing plant's potential.

Over the years Paradise Seeds has earned a reputation for great genetics. We have been at the forefront of game changing developments in the cannabis industry – one of the companies that pioneered auto-flowering and feminized seeds and, in recent years, advancing CBD rich medical varieties.

We now have over 40 strains in the Paradise Seeds vault. Through extensive research and development we have developed a range with stand out qualities such as strain stability, quick finishing, high yield and resistance to mold and disease.

People often ask, “what makes the best quality cannabis seed?” Our answer is simple. We use the best genetics to create plant varieties that carry a strong heritage through their line.

Paradise Seeds has been selling seeds to satisfied growers for over 25 years. Whatever your preference – Sativa, Indica, medical purpose CBD – we have a premium strain that is a perfect fit for your garden or grow room, however big or small.

WHICH CANNABIS SEEDS TO BUY?

When you buy a Paradise Seeds seed you are buying into a well established history. We have been running breeding programs for over 25 years and our strains carry the genes of champion plants. Signs of good breeding are high germination rates, uniformity (plants grow and look the same), resistance and superb taste and effect.

FEMINIZED SEEDS

Feminized seeds provide an almost 100% guarantee that your seed will grow into a female plant, that will flower and produce buds (compared to the male which does not). Paradise Seeds was one of the first companies to bring feminized seeds to the market and this innovation has changed the cannabis industry. Growers have got accustomed to the convenience of planting a seed that is guaranteed to produce and feminized plants can be grown indoors or outdoors.

AUTOFLOWERING FEMINIZED SEEDS

Autoflowering seeds will flower, regardless of the light (per day), within 70 – 80 days. This miracle of nature is the result of crossing our feminized strains with the ruderalis, a short cannabis plant that grows in the Arctic circle and flowers automatically. The result is a very easy plant to grow – which is ideal for beginners, guerilla growing and outdoor gardeners in northern regions where the climate isn't so cannabis friendly. Autos also work very well in a grow room (20/4 hours of light/darkness for best results). They grow shorter than feminized plants so yields will be less, but the big advantage is their versatility.

HIGH CBD FEMINIZED SEEDS

CBD cannabis seeds have been bred to produce plants that are better suited for patients suffering from a range of medical conditions. Whereas THC produces the 'high' sensation desired by recreational users, CBD produces relaxation and pain relief effects. Understandably, patients seeking an alternative to pharmaceutical drugs are often new to cannabis. Therefore, our High CBD strains offer all the medical benefits without the stoned effect.

QUALITY CONTROL + GERMINATION

Paradise Seeds seed bank offers a range of stable feminized, autoflowering and High CBD varieties. Quality control is very important to us and all of our cannabis seeds are organically produced. Paradise Seeds guarantees a 95% germination rate, if the growing conditions are right.

We only sell fresh and mature seeds, regularly testing them to ensure viability and germination rates. We work to strict criteria regarding the pollination of our plants and hand select only the best seeds from each batch.

Once selected, our seeds are randomly tested for viability and germination effectiveness. This way we can guarantee our customers will always get fresh, living seeds that are sure to grow into top quality plants.

GROWING CANNABIS PLANTS

In our experience, many people new to growing need a little help to get the best from their plants, and naturally, we want you to get the most out of your Paradise Seeds purchase.

There are many sources of information regarding the growing of cannabis plants, from the internet to grow handbooks. Paradise Seeds has its own FAQ section which is packed with useful tips for growing healthy cannabis plants with big and flavorful buds. You can find this on the Paradise Seeds website.

Our best advice for growers is to choose strains that are suited to your preferences and growing conditions; What effect do you desire? How big is your growing space? Where are you geographically, if you are growing outdoors?

YouTube: ParadiseSeedsCom

WHAT IS THE BEST GROW METHOD?

If you are asking this question, then we are guessing that you are new to growing! If this is the case then we recommend growing your cannabis seeds organically in soil.

Many inexperienced growers are attracted to the thought of using a hydroponic system because they hear that growing with hydroponics produces bigger yields. This can be true, but only if you know what you are doing.

Growing in soil is cheaper and easier for beginners – whether you are growing indoors in a small grow tent, or outdoors in a garden. The down side is managing watering and the potential for problems caused by pests and diseases. However, through good management and good hygiene, these are risks that can be minimized.

Paradise Seeds cannabis strains will produce good harvests grown in soil or using a hydroponics set up. Alternatives to soil include coco fibre, which aids root development and aeration, and rock wool. There is a lot of information out there and we suggest you do your research to find out which system is best suited for you. A great starting point is the FAQ section on the Paradise Seeds website.

CULTIVATING CANNABIS

The benefits of growing your own cannabis are obvious – you can control the quality and it is cheaper and safer than buying off the street. There is a good reason why the cannabis plant is referred to as ‘weed’ - give your seeds the right conditions and your plant will grow!

INDOOR GROWING

There are plenty of options for the modern day grower to make use of even the smallest of grow spaces thanks to improved technology and shared knowledge of growing techniques. Indoor growing allows the grower to control factors such as temperature and light, which brings consistent results. Make sure the temperature does not exceed 25 °C (77 F) or get cooler than 20°C (68 F). The room should be well ventilated and constantly refreshed with air.

Every grow space is different and it will take some time and a little experimentation to find what works best for you. However, once you have found what works, you will be rewarded time and time again. The internet is a great source of information and experts’ grow handbooks are a useful reference guide to have at hand.

OUTDOOR GROWING

Growing in the garden or in an outdoor space has its advantages but outdoor plants need good management to combat threats such as pests, diseases and mold brought on by cooler and wetter weather. However, this challenge is part of any gardening experience and makes the rewards that much sweeter!

Once the cannabis plants are 15-20 cm (6-8 inches), they can be planted outdoors, in rich soil – direct in the ground or in large pots for easier management. Outdoor growing is possible in between the indicated degrees in n.L (northern Latitude) and s.L. (southern Latitude). Harvest time for feminized seeds will be anywhere between the end of September and end of October.

Plants will finish earlier than indicated and yield more when grown closer to the equator. Many growers in more northern regions prefer to use a greenhouse or polytunnel to create a better environment for their plants and extend the growing season. Our range of Auto plants are also perfect for less hospitable climates as they will flower and finish automatically between 70 – 80 days.

NUTRIENTS / LIGHTING

As with any plant, getting the right amount of light and nutrients is the key to healthy growth and the best results.

LIGHTS

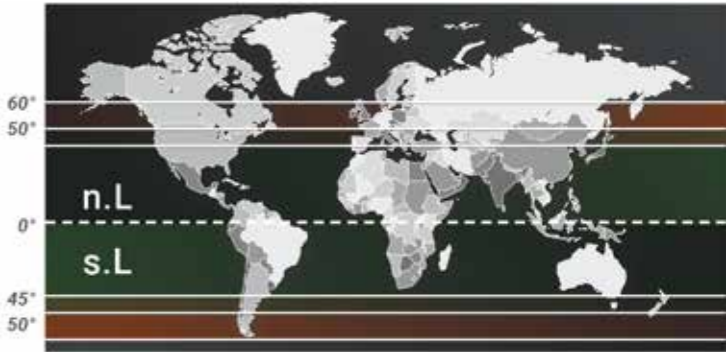

Although there is no substitute for glorious sunshine, technology has greatly improved the effectiveness and efficiency of light systems for indoor growing. Indoor growers have traditionally used HPS lights although in recent years LEDs have become more popular. Both types of light require a minimum of 400 watts pm².

LED lights provide good options for growers with limited space, ideally combined with growing techniques such as SOG/SCROG (Sea/Screen of Green) and LST (Low Stress Training). In these processes, the plants are trained and sculpted to produce a carpet of buds.

NUTRIENTS

The most common mistake of new growers is to overuse nutrients. Cannabis plants require different levels of nutrients during different stages of their life and can best absorb all necessary nutrients at a pH value of 5.5 - 6. There are many products on the market and Paradise Seeds does not recommend any in particular, although we always say ‘Go organic’!

All reputable nutrient companies have detailed information on feeding schedules and timetables. Information is freely available on the internet and joining a growers’ forum is a great way to pick up tips. Our best advice for best results is to follow the manufacturer’s instructions and keep an eye on plants to spot early signs of deficiency.

HARVEST TIME

The first guide to harvesting a Paradise Seeds plant is to read the instructions on the packet which gives approximate finish times for the strain (or consult the strain information on our website).

Harvesting a plant is all about timing. For the outdoor grower, climate conditions play a big factor (for example if the plant begins to develop mold it will force a premature harvest) and for this reason harvests are easier to manage with an indoor set up. Always ensure your plants are fully ‘flushed’ with water to remove traces of nutrients as the buds approach harvest time.

Checking the color of the trichomes (the crystal resin glands that coat the buds) is the most reliable indicator of when to crop - a magnifying glass will help with this identification process! The trichomes should be milky/cloudy. Another indicator is the pistils (or ‘hairs’ on the buds) and when over 50% of the pistils have turned brown/orange it is a good indication that your crop is ready.

Harvested plants should have fan leaves removed and be hung upside down in a dark warm place with good air circulation for up to 14 days before cutting the other leaves away and separating the buds. Take a stem and bend it. If it breaks then the bud is dry enough to store. Place in airtight jars which should be opened each day for a week or so to ‘burp’ the buds and allow any moisture to escape. Yes, it takes time to cure bud well, but your patience will be rewarded!

ACID®

Acid is Paradise Seeds' delicious twist on the classic New York Diesel. We selected a Diesel mother plant and crossed it with one of our favorite Dutch genetics to create a powerful indica dominant hybrid.

The taste is sour with a metallic hint and, as you would expect from the name, this plant comes with an almost narcotic high that is uplifting to the point of psychedelic.

With enhanced potency and extra yield potential we think you'll agree that this is a very pleasing update on the original. Acid has been described as a 'joy to grow' which is good news for beginners, but the familiar Diesel taste and extra punch of its potency also makes this plant a favorite with nostalgic old pros.

Indoors, this Paradise Seeds strain is an excellent performer. It will achieve a manageable height, producing branches that bulge with dense colas, bringing a powerful fruity aroma to your grow room as harvest time approaches.

Outdoors, it will grow in most regions, including those with a more moderate climate, but it will really thrive in the warmth and sun of more Mediterranean conditions where it will possibly exceed our suggested yields.

Suitable for growing outside between 50° n.L. and 50° s.L., Acid finishes at the end of October outdoors (n.L.) and between 9 – 10 weeks inside. Estimated yield is 400 g per m² indoors / 700 g per plant outdoors.

5 € 40,-
10 € 75,-

ALLKUSH®

Allkush is a super resinous plant that combines old-school Kush with Dutch genetics to produce a very satisfying update to this classic strain.

With a sweet, slightly musky taste and a dynamic and long lasting effect, thanks to the indica dominance, Allkush will produce a wide grin and a full body effect without nailing you to the floor. The relaxation qualities of this plant make it the choice of many medical customers with previous cannabis experience.

What we love about Allkush is its versatility. The great hash making potential of the Kush plant that inspired many canna-pilgrims to take the 'Hippie Trail' to Pakistan and Afghanistan in the 1970s. Thick colas produce large and dense buds that are crystalline and oozing with resin.

Indoors, it is a super plant to grow indoors and a popular strain with both beginners and experienced growers. This plant is more on the short and stocky side, filling out, bush style, with thick branches.

Outdoors, Allkush is a plant that is better suited to regions with more warmth and sunshine and can reach heights of more than 2 meters in regions with a more Mediterranean climate.

Suitable for growing outside between 50° n.L. and 50° s.L., Allkush is ready to harvest mid October outdoors (n.L.) and between 8 – 9 weeks indoors. Estimated yield is 450 g per m² indoors / 600 g per plant outdoors.

5 € 60,-
10 € 110,-

ATOMICAL HAZE®

Atomical Haze is a real treat for all you haze connoisseurs out there. Paradise Seeds has taken this all time classic strain and given it a remix to produce an explosive plant that combines sativa power with high yield capabilities.

The flavor is sweet and hazy, with sour undertones that tickle the tongue. This sativa announces itself with a powerful, long lasting high that lifts the user with narcotic euphoria and is good for day smoking or an evening pick-me-up.

We would suggest Atomical Haze for more experienced growers as it needs a little more attention than many of our strains. This plant produces big juicy buds that practically pick themselves there is so little trim.

Best grown indoors, from seed to flower, it reaches for the light but is more restrained than many hazes and responds well to training. With good management the results are very favorable, producing a high yield that is unusual for a sativa.

Outdoors, Atomical Haze will reward the gardener in regions where the sun and warmth are plentiful. While the late finish doesn't make it the best choice for cooler climates, the sativa element will give some protection against mold.

Suitable for growing outside between 55° n.L. and 55° s.L., Atomical Haze finishes at the end of October outdoors (n.L.), while indoor finish time is 9 weeks. Estimated yield is 450 g per m² indoors / 800 g per plant outdoors.

5 € 30,-

10 € 55,-

BELLADONNA®

Belladonna is one of our original old school strains. This fast finish sativa with great yield potential is a multi award winner and is as popular now as when we first released it 15 years ago.

The Belladonna flavor is characterized by the pungent fruitiness that is followed by a sativa induced euphoric high that borders on the psychedelic. If you like your weed a little trippy then this is the strain for you.

A great plant to grow, this one is good for both beginners and experienced growers. This plant became an instant favorite when we first released it thanks to outstanding reviews and recognition of its potential as a good commercial crop with a big harvest.

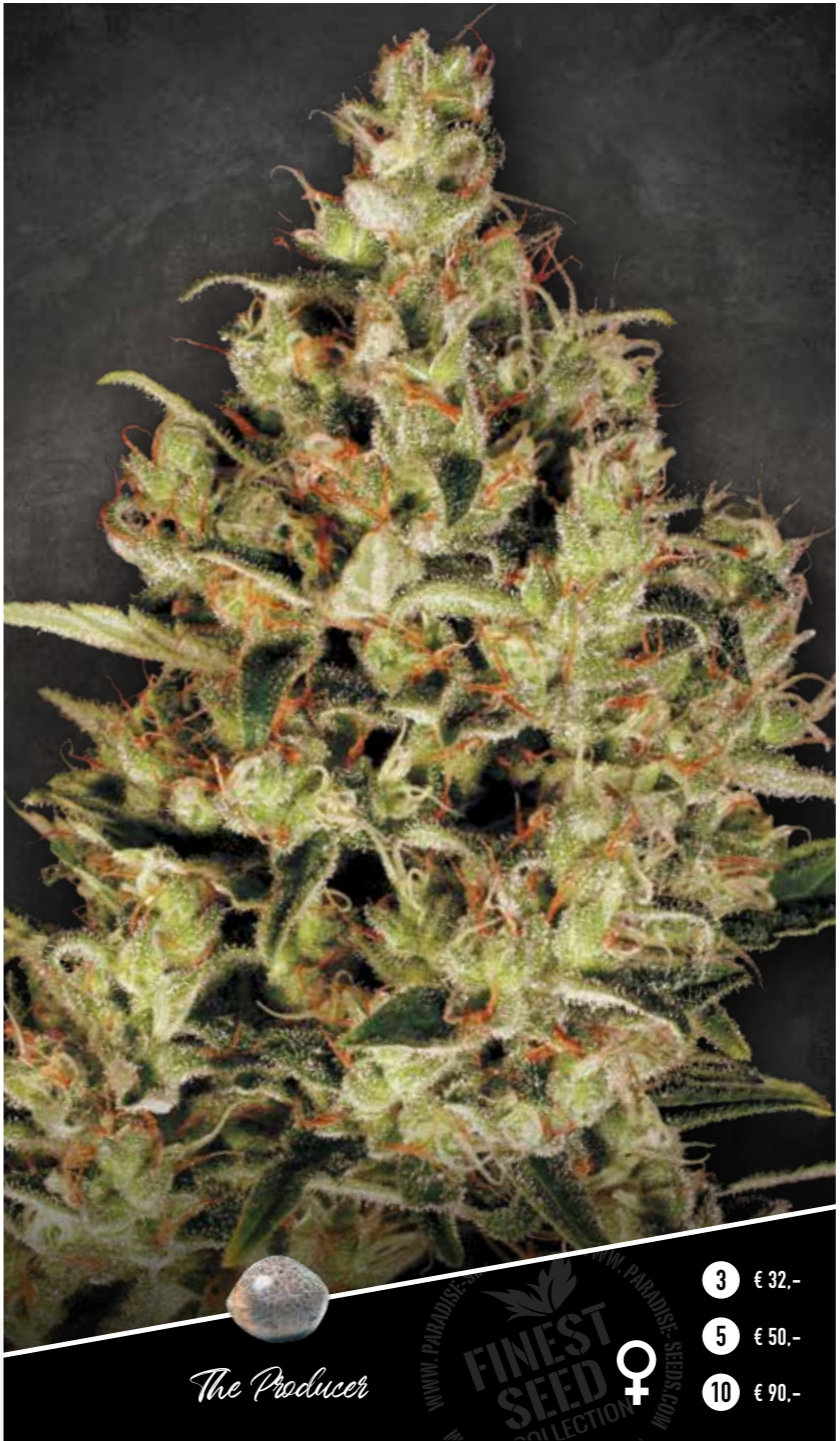

Indoors, Belladonna will thrive. It's a low maintenance plant and the tight buds and reduced foliage give it a natural defense against mold and fungi. It is also a superb plant for growers that have their grow rooms set up for SOG/SCROG.

Outdoors, this is a great strain for growing in more northern/cooler regions as it has been bred with mold resistance and, naturally, it will flourish given some Mediterranean warmth and sun.

Suitable for growing outside in regions between 55° n.L. and 55° s.L., Belladonna is ready to harvest by mid October outdoors (n.L.) and between 8 – 9 weeks indoors. Estimated yield is 450 g per m² indoors / 800 g per plant outdoors.

DELAHAZE®

Delahaze is a new generation Paradise Seeds strain that takes haze to the next dimension. It is a multi award winning sativa that finishes quick and yields big.

The taste is of haze with a refreshing flavor of citrus with shades of mango. As for the effect, it's a super clear creeping high that is euphoric and energetic. It's a great all day smoke and good for an evening out too.

This strain is popular with sativa aficionados, recreational and commercial growers, thanks to its quick harvest time. Delahaze produces upward spiraling compact buds that protrude from big top and side colas, all the more visible thanks to a high calyx-to-leaf ratio.

Indoors, Delahaze is a good choice for a grow room set up. However, we recommend inducing it to flower early on in vegetation in order to keep it under control, as the sativa gene means this plant does like to climb.

Outdoors, Delahaze is not the best recommendation for gardeners in moderate climates but expect this plant to reach for the sun and respond very kindly to the warmth of a sunnier climate where the rewards will be very pleasing.

Suitable for growing outdoors between 45° n.L. and 45° s.L., Delahaze is ready to harvest in early November outdoors (n.L.), while indoors the finish time is 9 – 10 weeks. Estimated yield is an excellent 500+ g per m² indoors / 1000 g per plant outdoors

DURGA MATA®

Durga Mata is a heavy indica with a reputation for sweet tasting relaxation. Long before medical CBD strains were developed, this strain was a popular with smokers seeking assistance for medical conditions.

The taste of Durga Mata is distinctive, and the perfumed aroma has been described as having a Turkish Delight quality. The effect is one of deep relaxation and contemplation, a very pleasant and earthy old school smoke that is potent without being overbearing.

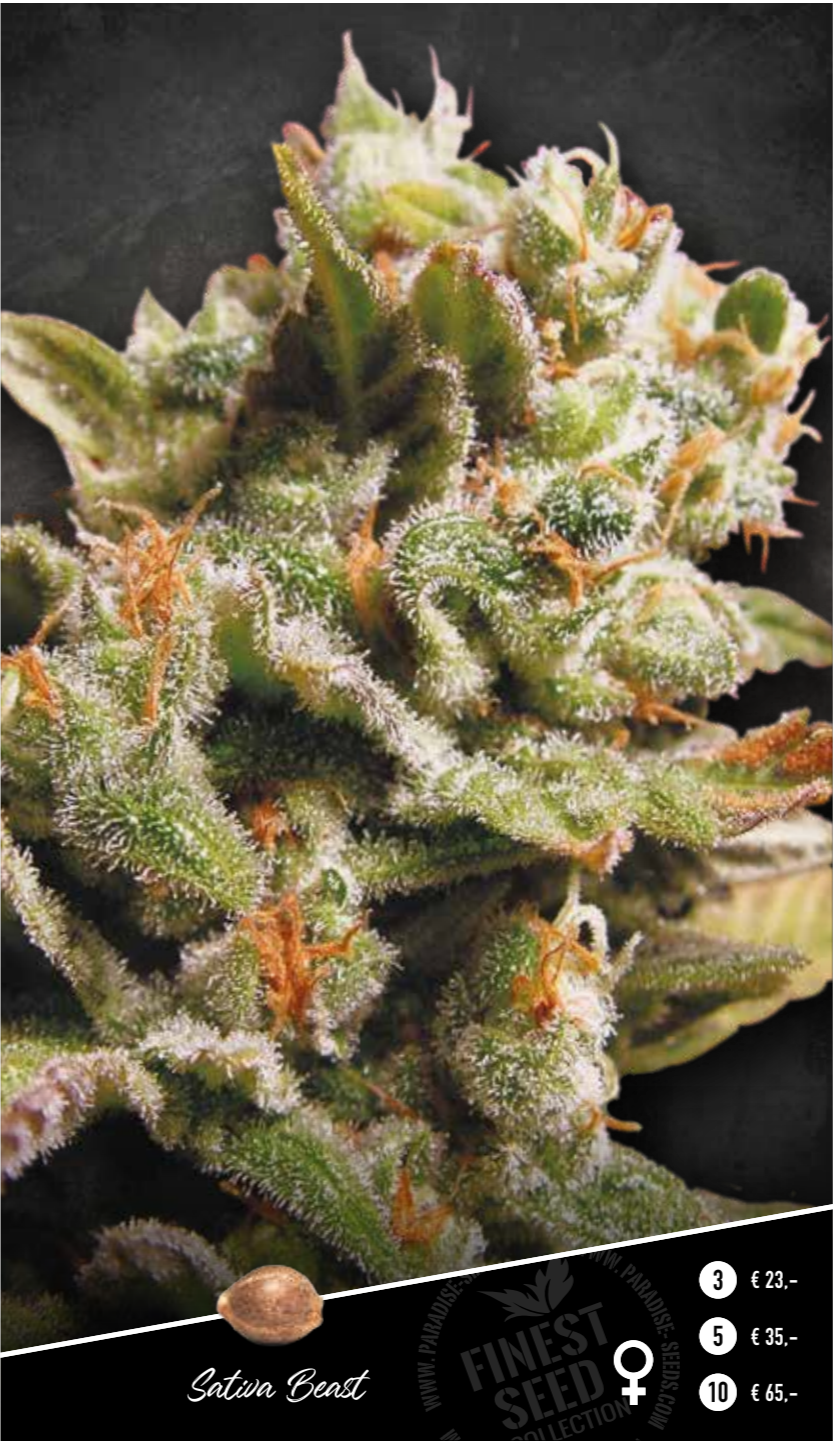

This is a great strain for beginners because of the forgiving nature of the plant which is very hardy and needs little maintenance. Stout and bushy, its branches allow for the growth of decent sized indica buds.

Indoors, Durga Mata is a very pleasing companion for the grow room, very low maintenance and easy to manage. Its size also makes it a good companion for growers with SOG/SCROG set ups.

Outdoors, this plant will respond well in cooler northern regions because it does not need so much light as other strains and it has been bred to have a good defense against pests. Nevertheless, it will also thrive in warmer climates.

Suitable for growing outside between 55° n.L. a 55° s.L., Durga Mata is ready to harvest at the beginning of October outdoors (n.L.) and finishes in 7 - 8 weeks indoors. Estimated yield is 425 g per m² indoors / 600 g per plant outdoors.

 90% INDICA	 18 - 22%	 Perfume
 100 cm 425 g/m²	 56 Days	 150 cm 600 g/pl.

DUTCH DRAGON®

Dutch Dragon is one of our award winning sativa strains. Combining Swaziland roots with Dutch genetics this plant is famed for its power and big harvest potential.

A great tasting smoke, with a flavor that is sweet and fruity, Dutch Dragon will roar into effect with a clear and uplifting buzz that will fly you through the day and enhance your evening activities.

The African heritage means that this is a robust plant that grows vigorously and likes to reach for the light, so it does need some management. It is characterized by the predominance of sticky colas which produce thick and juicy buds.

Indoors, Dutch Dragon could be a challenge for a beginner, but once tamed this beast has the potential to yield big, making it a good commercial choice. Despite its tendency to grow tall, Dutch Dragon is receptive to training so performs better in a grow room than may be expected.

Outdoors, it is a dream to grow. It will respond magnificently to warmth and sunshine and we have seen some specimens as high as 3 meters! More restrained in cooler climates, it still has good performance potential.

Suitable for growing outside between 50° n.L. and 50° s.L., Dutch Dragon is ready to harvest mid October outdoors (n.L.), and after 9 - 10 weeks indoors. Yields are excellent with 500 g per m² inside / 1000 g per plant outside.

Lowlands Classic

DUTCH KUSH®

Dutch Kush combines classic Kush with Dutch genetics to create a new strain with enhanced superpowers. This powerful indica is one for couch lockers and medical users seeking ultimate relaxation.

This is a very flavorful smoke, a swirling combination of earthy caramel, citrus and sweet skunk. Bred for a powerful lift off, the effect kicks in with a sense of deep relaxation and heightened sensory awareness.

While the popularity of the Kush has seen many new entries in to the market, we have taken our time to perfect our own take on this classic. The result is a resinous plant with accelerated growth power, excellent calyx development, compact colas and dense aromatic buds.

Indoors, Dutch Kush is a great plant to grow. Short, bushy and easy to manage, the distinctive cola development makes this a fine option for SCROG/ SOG set ups too. Good for beginners and experienced Kush heads, we advise keeping carbon filters well maintained because this is some stinky bud.

Outdoors, it is a good choice too. This plant loves the warmth and the sun that dominates in warmer climates, although the quick finish will also offer some guarantee of good results in more northern regions.

Suitable for growing outside between 50° n.L. and 50° s.L., Dutch Kush finishes in mid October outdoors (n.L.) and between 8-9 weeks indoors. Estimated yield is 500 g per m² indoors / 1000 g per plant outdoors.

La Ferrari

ICE CREAM®

Ice Cream is one of our new generation specialist strains. This is an award winning turbo powered indica that was an instant hit when we first released it and continues to be a super popular ride.

It comes with an exotic flavor, a heady mix of vanilla skunk and pineapple that delivers a smooth taste and a trippy effect. Its ability to impact both head and body has won recognition amongst smokers and cannabis cup judges.

Bred to be the perfect plant for the indoor set up, it starts off slow but accelerates rapidly (which is how it got its Ferrari nickname), producing thick, resinous heads that line up in regimental rows, buds glistening with trichomes.

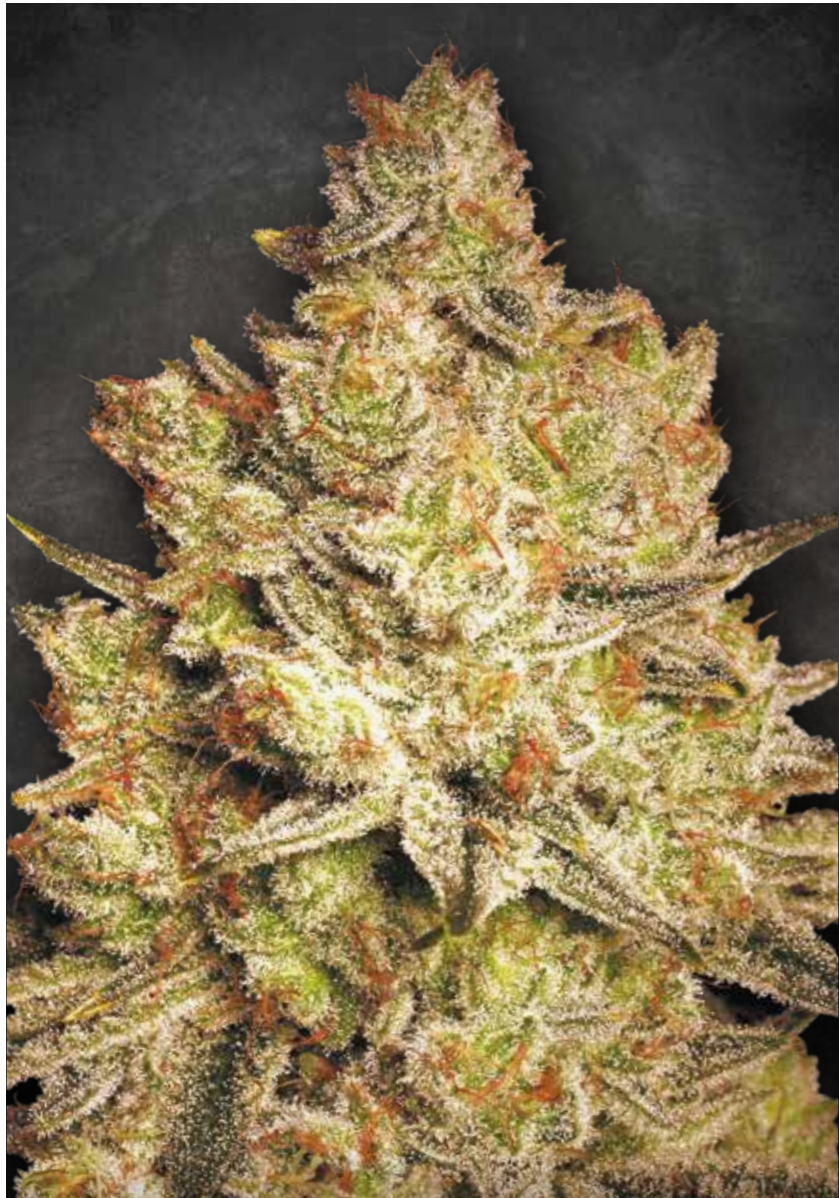

Indoors, grow room gardeners will love this plant! It has excellent growth formation and rarely exceeds 1 meter in height. The bushy, stout nature makes it ideal for multi branch growing or as part of a SOG/SCROG set up.

Outdoors, it is a popular choice with those gardeners tempted by its indica power. It will not disappoint when grown in the garden, even in more inhospitable northern regions, although the yield may not be so impressive.

Suitable for growing outside between 50° n.L. and 50° s.L., Ice Cream will be ready to crop in early October outdoors (n.L.) and in 8-9 weeks when grown indoors. Estimated yield is 500 g per m² indoors / 700+ g per plant outdoors.

JACKY WHITE®

Jacky White is a new generation Paradise Seeds sativa with a reputation for being the ultimate performer. It is a big harvest, quick finish plant that became an instant favorite the day we released it.

This sativa comes with a deliciously intense taste of citrus with grapefruit tones. The effect is an uplifting and pleasant high that is clear and energizing. A great get up and go smoke that is good for all day.

Jacky White is a hardy, low maintenance plant, with a good calyx-to-leaf ratio. The branches support generous top and side branch development, producing a crop of long and well formed buds, super frosty with trichomes.

Indoors, it may require some management, with a little bending and training to control its sativa instinct to stretch. It has an excellent reputation for its genetic stability, providing result consistency growers can rely on.

Outdoors, it is a good friend for the gardener with its easy management. This plant will naturally thrive in a warmer climate with plenty of sunshine, however, it is also a sativa that performs well in more moderate climates which is good news a aficionados in northern regions.

Suitable for growing outside between 50° n.L. and 50° s.L., Jacky White will finish in mid October outdoors (n.L.), and be ready to crop between 8 – 9 weeks when grown indoors. Estimated yield is 500 g per m² indoors / 750 g per plant outdoors.

NEBULA®

Nebula is our award winning sativa dominant hybrid that is loved by growers and tokers alike. This is one plant that promises to boldly go where few have been before.

The taste is honey sweet and fruity. The effect is a heady high, with a trippy element that makes this a fun smoke. The uplifting effect is accompanied by a mellow indica trail that makes it a great all day smoking companion.

This plant does like to stretch a bit, its moderate side branches become filled with densely packed flowers which produce excellent buds that are as tight and as hard as little space rocks.

Indoors, it is a fine choice for any grow room, although it should also be noted that this plant does like some extra light for best results. However, It is also very receptive to training so will fit in nicely to a SOG/ SCROG set up.

A great outdoor performer too, Nebula beats with a Mediterranean heart so loves sun and warmth. However, it is also a robust and versatile plant that will prosper quite happily in more northern regions, especially if sited in a south facing plot.

Suitable for growing outside between 50° n.L. and 50° s.L., Nebula will finish in early October outdoors (n.L.) and between 8 – 9 weeks indoors. Estimated yield is 500 g per m² indoors / 750 g per plant outdoors.

OPIUM®

Opium is a straight down the middle mix of sativa and indica whose regal presence has earned multiple awards and is recognized for its heavyweight outdoor harvests.

This plant comes with a superb flavor, fragrantly fruity and with a creamy taste. The sativa/indica mix produces a very pleasant, long lasting high that is relaxing yet lucid and productive.

A plant that is easy to grow this one is a hit with both beginners and old pros thanks to its versatility. It grows strong, with a thick stem and bushy side branches which produce big and heavy buds that are frosted over with trichomes.

Indoors, Opium will impress, and works particularly well in grow set ups using a hydroponic system. Adaptable, it will perform well as a multi branch plant and its receptiveness to training also makes it a great performer in a SOG/SCROG set up.

Outdoors, it will respond to plenty of warm sunshine and in more Mediterranean climates the harvest potential is huge and we have seen some specimens developing into bushes of epic proportions. Not the best recommendation for more moderate regions where its big buds may invite mold.

Suitable for outside growing between 50° n.L. and 50° s.L., Opium will finish in early October outdoors (n.L.) and be ready to harvest between 8 -9 weeks indoors. Estimated yield is 450 g per m² indoors / 1000 g per plant outdoors.

ORIGINAL WHITE WIDOW®

Original White Widow (IBL) is old school, all the way. A plant that needs no introduction, this is an explosive combination of sativa and indica that yields big and hits hard.

The taste of this classic variety is floral with hints of pine, a full flavour plant that delivers a powerful effect. A straight down the middle sativa/indica split creates a potency that can catch out even the most experienced smoker.

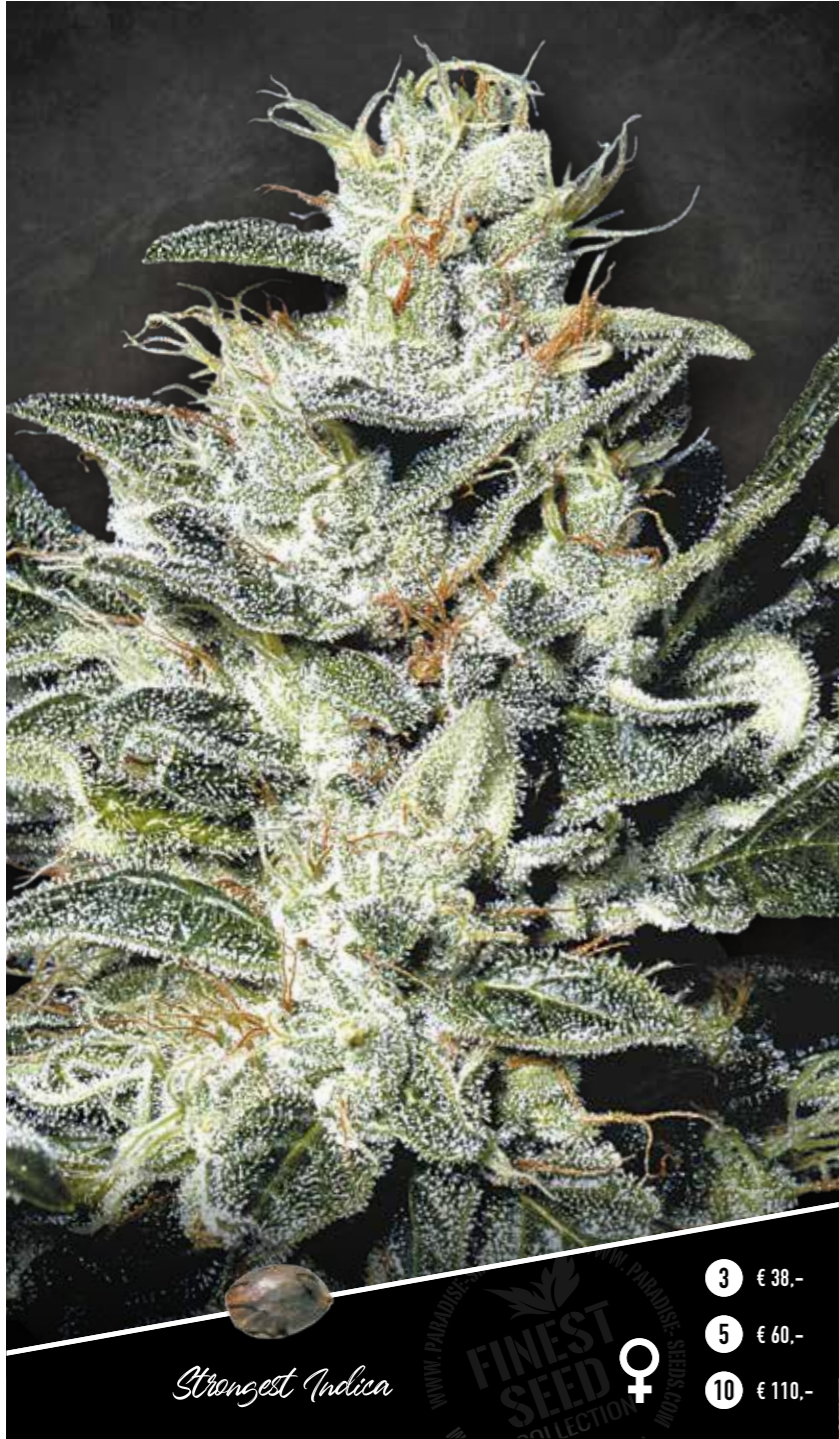

This is another original strain (In Bred Line) that Paradise Seeds decided was just too good not to share. It's a sturdy plant that displays uniform growth patterns, becoming bushy early on and stretching in flower. The payload is a shower of dense and juicy buds with an intense trichome frosting.

Indoors, Original White Widow is a grower's gift, popular with beginners and the experienced. Expect plants to grow to approx 1m and display consistency of form, with the potential for a harvest that will generously fill your basket.

Outdoors, this is a universally good performer. In warmer and sunnier regions it can reach heights of 2 meters or more, while even in more moderate climates of northern regions it will achieve great things.

Suitable for growing outside between 50° n.L. and 50° s.L., Original White Widow has an early October harvest time outdoors (n.L.) and will finish in 8 – 9 weeks indoors. Estimated yield is 500 g per m² indoors / 700 g per plant outdoors.

10 € 110,-

SENSI STAR®

Sensi Star is one of the strongest indicas you will ever smoke. This multi award winning strain takes pride of place in our collection because it is the plant that put Paradise Seeds on the map.

The flavor is pure sweetness with shades of citrus and mint and metallic undertones. The effect is quick, delivering a heavyweight punch that will knock you into your couch although a sativa kick brings some vigor to the stone.

This is a most pleasing plant to grow and will work for beginners as well as experts. Smaller than many plants, it's fat and stout with bushy side branches that hang heavy with dense indica buds. It produces rock hard colas that glisten with glow in the dark crystals.

Indoors, Sensi Star is a great grow room addition as its small size makes it a good fit and it will respond well to hydroponic and soil grow mediums. Its small but perfectly formed stature makes it an excellent option for a SOG/SCROG set up.

Outdoors, this indica prefers the warmth and the sun to develop those heavy buds although we have seen some fine specimens grown in gardens in more northern regions too.

Suitable for outside growing between 50° n.L. and 50° s.L., Sensi Star will finish in early October outdoors (n.L.), and in 8 -9 weeks indoors. Estimated yield is 400 g per m² indoors / 600 g per plant outdoors.

WAPPA®

Wappa is one of the most popular Paradise Seeds strains for good reason. This fruity indica is easy to grow, yields big, finishes fast and produces some of the juiciest buds you could ever wish for.

Its sweet Skunk heritage provides a fruity flavor with a hint of strawberry. Wappa delivers an indica hit, but never drags you down into a couch lock. The relaxing, but uplifting, experience makes it a great all day indica and it's also popular with medical users.

A good plant for beginners and pros, Wappa is a fantastic performer that keeps on giving. Stout and sturdy, with a high calyx-to-leaf ratio, the chunky bud count makes it popular with recreational and commercial growers.

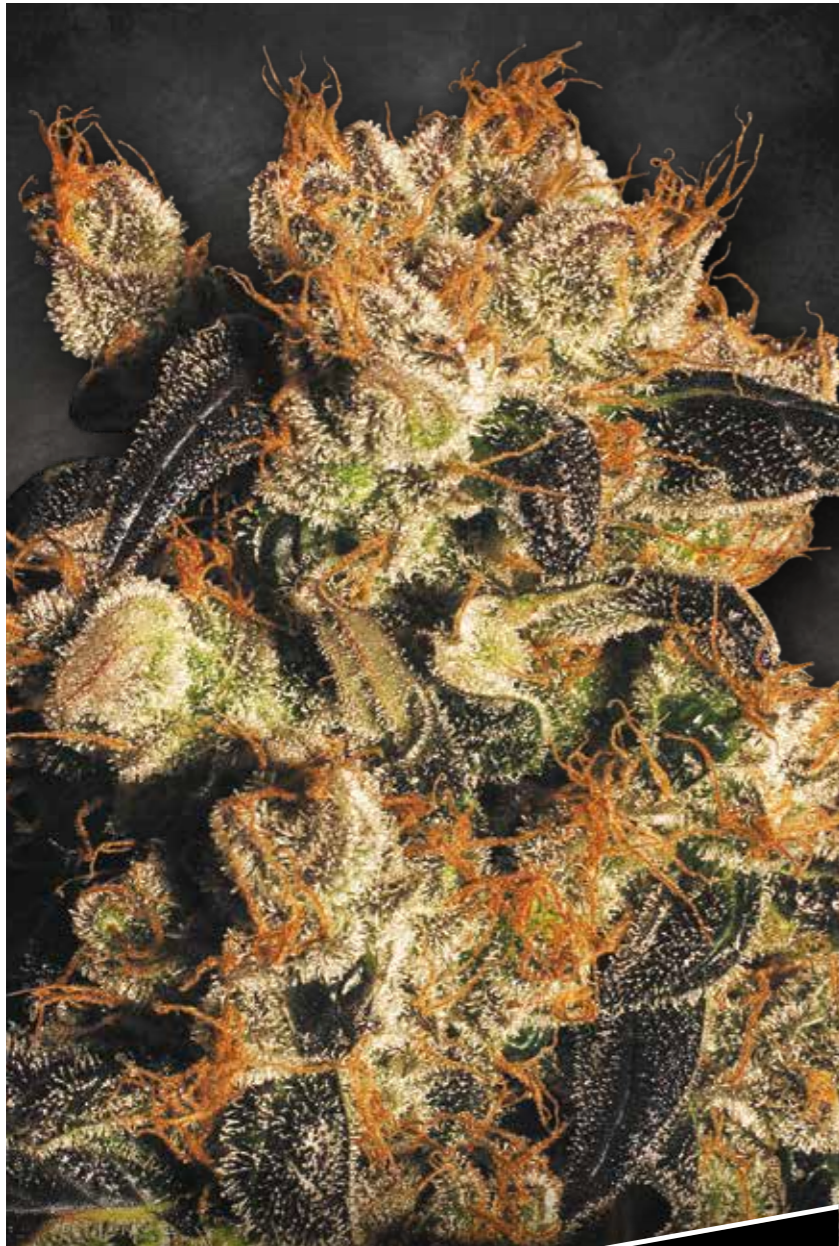

Indoors, it's small size makes it an ideal companion for any grow room. The thick central cola and proliferation of buds hanging from the side branches make harvest time a joyful affair.

Outdoors, Wappa will perform with flair. In more Mediterranean climates the sun will fatten those buds and boost the harvest potential. In more moderate climates, buds will need checking when mold season arrives, but growers won't be disappointed with the results.

Suitable for growing outside between 50° n.L. and 50° s.L., Wappa is ready for harvest in early October outdoors (n.L.) and in 8 - 9 weeks indoors. Estimated yield is 550 g per m² indoors / 700 g per plant outdoors.

WHITE BERRY®

White Berry is a Paradise Seeds new generation indica that we are very proud of. This plant is as close as we have come to making a model cannabis plant and it is a real favorite with the cannabis connoisseur.

The taste of this plant is dominated by berries, with pine undertones. The effect has been described as 'complex'. It combines a heady sativa effect with an indica body hit that has even the most experienced smokers pleasantly intrigued.

Not too big, not too short, White Berry benefits from being a medium sized plant with bud growth concentrated around its single cola. Once in flower the generous, dense buds become coated with glittering trichomes.

Indoors, growers working in small spaces will appreciate the size of this plant, which grows no taller than 1 meter and yet produces an excellent return. A versatile plant that will respond well to training, it is ideal for a SOG/SCROG set up.

Outdoors, White Berry will soak up the sunshine of southern regions and turn those sunbeams into beautiful heavy buds. However, this plant will also grow well in more northern regions where the climate is moderate.

Suitable for growing outside between 50° n.L. and 50° s.L., White Berry will be ready for harvest in early October outdoors (n.L.) and in 7 – 8 weeks indoors. Estimated yield is 425 g per m² indoors / 450 g per plant outdoors.

WHITE NOISE®

An Amsterdam coffeeshop classic gets a 2020s upgrade with extra frosting and enhanced flavors. White Noise is a mostly indica (80%) White Widow x Space Cookies cross. It's superbly well balanced, sticky fingered oily and has great resistance qualities.

The mix of classic old school Amsterdam and contemporary California bling produces an aromatic blend of sweet citrus, vanilla and pine which is countered by tones of earth, nut and peppermint. The taste is at once familiar and yet surprisingly unique while the effect combines lucid euphoria with contented relaxation.

This strain will appeal across the generations – to those who first met the White Widow many years ago and those discovering her joys for the first time. A straight up classic with a new Cookies refit, the extra dimension will be appreciated by all, from grow to consumption.

Indoors, White Noise will spread its copious branches horizontally without stretching much beyond 1 meter high, although it is recommended to encourage this with some early topping. For this reason it is an excellent fit for a SCROG or SOG set up.

Outdoors, the heritage of this plant provides great resistance qualities, especially against Botrytis, which will inspire confidence in growers far north of the equator. In the Mediterranean and sunnier climates, plant this seed and watch it grow to huge heights.

White Noise grows outside between 50° n.L. and 50° s.L.. It finishes in early October outdoors (n.L.), while indoor finish time is 8 - 9 weeks. Estimated yield is 450 g per m² indoors / 700g per plant outdoors.

80% INDICA	18 - 22%	Earthy, Sweet

APRICOT CANDY®

Apricot Candy is a big yield California sativa strain whose unique flavor profile is one for the connoisseur. It's an extremely potent and oily cannabis strain which oozes like a gourmet sweet dessert.

It's textured with layers of sweet flavor (figs, apples and of course... apricots!), a dominance of Caryophyllene contributing to its unique taste. The potency of the experience (20 - 24% THC) is nevertheless creative and clear before settling into a more relaxed Californian state of mind.

From a grower's perspective, sativa fans will appreciate the stability, uniformity and extra gush of resin which is a characteristic of Paradise plants. They will also appreciate the more indica growth pattern of the buds which plentifully hang from its solid branches.

Indoors, such a big plant will need some management in a confined grow space. However, indoor growers will be pleased to hear that it displays an indica characteristic in terms of its sideways growth and chubby bud production.

Outdoors, these plants grow like trees. Growers in all regions will enjoy the ferocious growth of Apricot Candy. In warmer regions the sky is literally the limit on its potential, but its performance will also impress in less sunny regions.

Suitable for growing outside between 50° n.L. and 50° s.L., Apricot Candy finishes at the end of October outdoors (n.L.), while indoor finish time is 9 weeks. Estimated yield is 550g per m² indoors / 1000g per plant outdoors.

70% SATIVA	18 - 22% < 0.1%	Fruity, Vanilla
100 cm 550 g/m²	65 Days	300 cm 1000 g/pl.

CALIFORNIAN GOLD®

Californian Gold is a hard hitting indica dominant hybrid that is easy to grow and yields an explosive harvest of super resinous buds.

One for the connoisseur, this plant has a fragrance of citrus and a depth of taste that is underscored by tones of lemon and mango. The effect is one of wonderful relaxation with a distinctive clarity which makes it popular with medical patients as well as recreational users.

This is one of the newer Paradise Seeds strains, released to commemorate the legalization of cannabis in California, the Golden State. There is something of a nostalgic touch to this variety, which combines old school feel good Californian genetics with added turbo boost.

Indoors, its medium size makes it a good grow room companion, especially where height is an issue. The quick flower time and dependable yield are further qualities to recommend in this variety and production is characterized by large compact buds that ooze resin.

Outdoors, Californian Gold will naturally thrive in warmer climates, where the sun will make those large indica buds swell. However, the hybrid nature of this plant makes it also adaptable to the cooler climates of more northern regions.

Suitable for growing outside between 50° n.L. and 50° s.L., Californian Gold will finish in early October outdoors (n.L.) and after 8 - 9 weeks indoors. Estimated yield is 500 g per m² indoors / 750 g per plant outdoors.

 80% INDICA	 20 - 24%  < 0.1%	 Sweet, Fruity, Mango
 100 cm 500 g/m²	 60 - 63 Days	 175 cm 750 g/pl.

CHOCOLATE WAFFLEZ®

Paradise Seeds brings a stylish 70% sativa into its Californian Collection, in the form of one dangerously delicious, super-fast finish, big harvest plant.

The sheer power of this strain (24% THC) comes wrapped in a deceptively sweet coating with dark chocolate and mint flavors swimming up between layers of Cookies and Haze. The Chocolate Wafflez effect is typified by its swift sativa take off accompanied by a significant amount of G-Force.

Growers who prefer sativas will love the fact that this plant has the capacity to grow so big. Handled right, however, this plant can make a sativa aficionado's dreams come true with its potential to yield big resinous, weighty buds.

Indoor growers should be aware that, at its core, this strain is a big plant and for this reason it needs to be shown some respect, but also needs discipline in the grow room to keep it in check.

For outdoor growers, with the sun and warmth to fuel it, this strain will do everything in its power to fulfil its big plant destiny! A vigorous climber, it will excel in southern regions but further north its performance will also be admired, as will its mold resistance.

Suitable for growing outside between 50° n.L. and 50° s.L., Chocolate Wafflez finishes at the end of October outdoors (n.L.), while indoor finish time is 9 weeks. Estimated yield is 600g per m² indoors / 1000g per plant outdoors.

🏆 Spannabis Champions Cup (Barcelona, Spain) • 2022

 70% SATIVA	 20 - 24%  < 0.1%	 Chocolate, Creamy, Mint
 100 cm 600 g/m²	 65 Days	 300 cm 1000 g/pl.

EL DORADO OG®

El Dorado OG is a wonderful indica trichome bomb that delivers a blast of heavy resin, medical quality feel good factor and a finely blended balance of terpenes.

This is a strain to tantalize the nose and tickle the taste buds with its combination of woody/earthy tones and spicy lemon and pine. A tonic for mind and body, El Dorado OG delivers profound relaxation and uplifting satisfaction without ever pinning the eyelids to the floor.

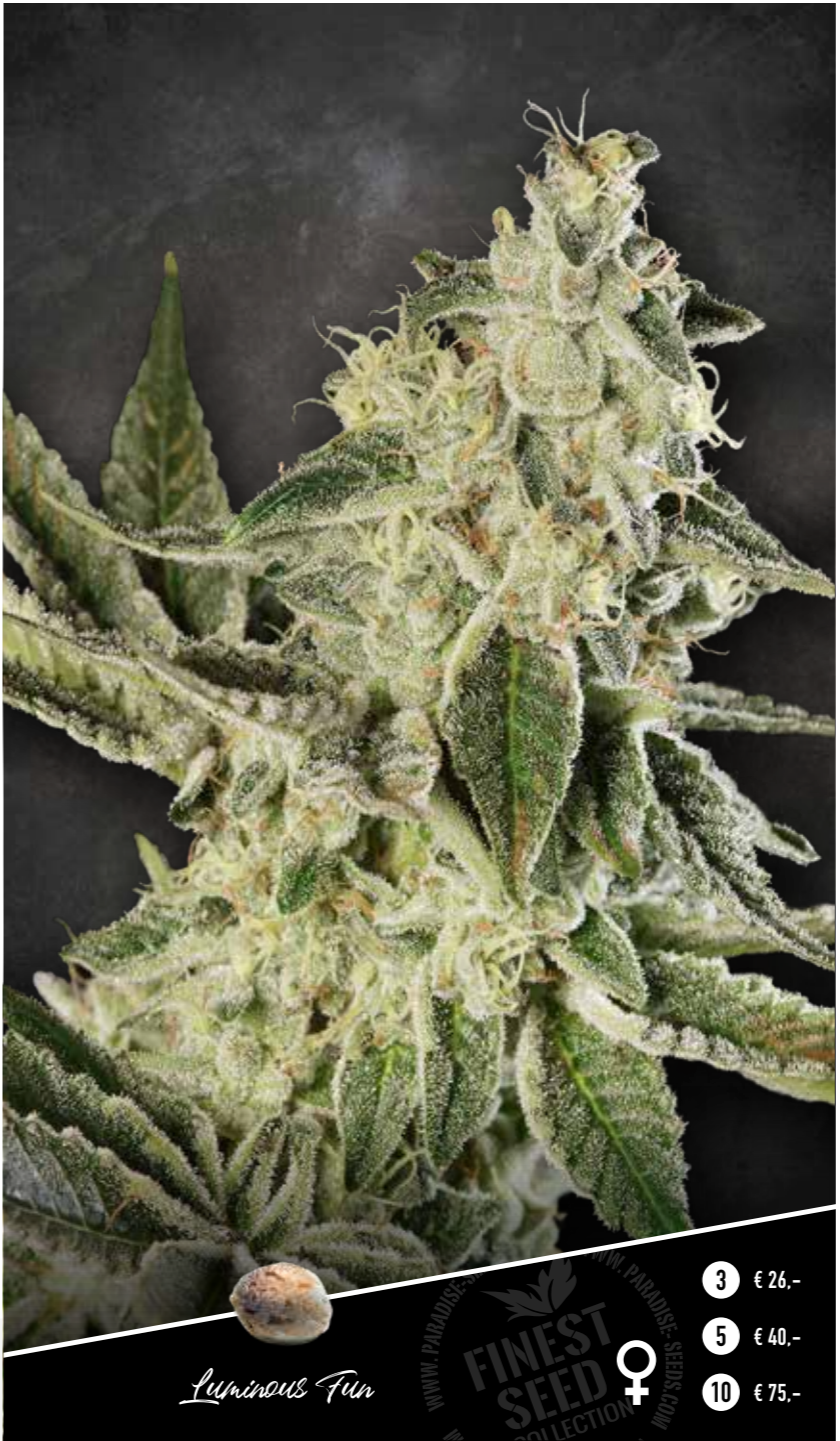

OG Kush runs through the heart of this strain, enhanced with Thin Mint GSC to produce a strain that is a smiley face companion for both day time and night time use.

Indoors, this is a great plant to have in the grow room, and its compact growth and manageable height is a great fit, especially for smaller spaces. Growth is characterized by tightly packed calyxes and dense flower clusters producing excessive hard trichome bomb buds.

Outdoors, El Dorado OG will thrive in the warmth and the sunshine where buds will respond by pumping out copious amounts of resin. It will also perform proficiently in more temperate regions outside the Mediterranean zone.

Suitable for growing outside between 50° n.L. and 50° s.L., El Dorado OG will finish in early October outdoors (n.L.) and after 8 - 9 weeks indoors. Estimated yield is 500 g per m² indoors / 1000 g per plant outdoors.

 90% INDICA	 20 - 24% < 0.1%	 Pine, Lemon
 100 cm 500 g/m²	 60 Days	 250 cm 1000 g/pl.

GLOWSTARZ®

Growers of all abilities will fall in love with Glowstarz, an SFV OG Kush/Gelato 33 cross. This big yield California Collection hybrid is adaptable and fun, its off-the-chart resin production coating plants with a luminous trichome stardust trail.

This is a real stinky strain. From the Kush comes deep earthy tones with notes of fuel, metal and hash while the Cookies brings a sweet pungent edge. Potent and resinous, the effect is a fine balance of feel-good euphoria and heavenly relaxation.

Paradise Seeds has a reputation for producing quality Kush strains and Glowstarz upholds that tradition. This one displays a more open growth structure, with thick flower clusters producing long fox tail colas which double up as little trichome factories.

Indoors, Glowstarz is really fun to grow. Height wise it should not exceed 1.5 meters and growers will cheer the reliability of the balanced genetics. The buds are more compact than traditional indicas, but their weight is in density and multi bud sites make this a high yielder

Outdoors, this plant is versatile with a capital 'V' – you know Glowstarz, you can stick them anywhere. It will adapt to a range of growing environments and extremes with excellent resistance qualities and natural defense against mold compared to many indicas.

Glowstarz can be grown outside between 50° n.L. and 50° s.L.. It finishes in early October outdoors (n.L.), while indoor finish time is 8 - 9 weeks. Estimated yield is 500g per m² indoors / 800 g per plant outdoors.

 60% INDICA	 18 - 22%	 Gas, Pungent
 150 cm 500 g/m²	 56-63 Days	 250 cm 800 g/pl.

RAINBOW ROAD®

Rainbow Road is a sativa monster with the dial turned up to maximum for sensory effect and probably the biggest yielding sativa Paradise Seeds has produced in its long history.

Its taste is a wonderful swirl of terpenes, with the scent of mango and strawberry and a taste that is a delicious potpourri of red fruits. The effect is an electrifying ascent to energetic clear headed heights followed by a pleasant state of deep inner balance.

Rainbow Road is the kind of cannabis strain that sativa devotees dream about. It is a Strawberry Haze/Hindu Kush cross that combines classic sativa qualities with additional turbo in the growth department and enhanced yield potential.

Indoors, it may need some training because this monster has a ferocious appetite for growth and will literally double its size again once placed into flower. Bud development is rapid with dense crystal coated nuggets literally dripping with resin.

Outdoors, this plant will soar towards the sun with Mediterranean region growers witnessing an incredible payload. A high calyx to leaf ratio and sativa genes will provide good mold protection and temperate climate growers will also benefit from impressive yields.

Suitable for growing outside between 50° n.L. and 50° s.L., Rainbow Road will finish in mid October outdoors (n.L.) and after 9-10 weeks indoors. Estimated yield is 600 g per m² indoors / 1250 g per plant outdoors.

 60% SATIVA	 18 - 22%  < 0.1%	 Sweet, Fruity
 140 cm 600 g/m²	 65 - 70 Days	 250 cm 1000 g/pl.

SPACE COOKIES®

Space Cookies is a powerful but harmonious hybrid that is the Paradise Seeds take on the modern American classic GSC (formerly known as Girl Scout Cookies).

Taste is a prominent feature of this strain, with full flavor terpenes characterized by sweet and pine tones. This sweetness is reinforced with real strength which oozes through this plant, producing an intensely relaxing effect and a sense of long lasting bliss.

Paradise Seeds has a history of bringing its own twist to classic strains. Space Cookies is no different, and is the result of some extensive R+D in the Paradise breeding program. Fans of GSC will appreciate the enhanced qualities resulting from extra genetic spice in the mix.

Indoors, stable genetics make this plant a superb addition to any indoor grow room set up. Medium sized, it is a plant that will grow without much encouragement and is relatively easy to manage which is good news for those new to growing.

Outdoors, Space Cookies naturally loves the sun of southern and Mediterranean regions but comes with good mold and pest resistance qualities that will protect it from the less friendly climate in northern regions.

Suitable for growing outside between 50° n.L. and 50° s.L., Space Cookies will finish in mid October outdoors (n.L.) and after 8 - 9 weeks indoors. Estimated yield is 550 grams per m² indoors / 1000 grams per plant outdoors.

Gelato Twist

WWW.PARADISESEEDS.COM
FINEST SEED COLLECTION

SUNSET PARADISE®

Sunset Paradise is the Paradise Seeds take on the exotic Gelato strain. This Thin Mint GSC/Sunset Sherbet cross comes with a colorful personality, quick harvest time and big, gooey bud production.

Its flavor is a delightful cocktail of terpenes, combining hints of lavender, fruity sweetness and a tinge of spiced skunk. The complex taste is followed by a full bodied effect that is intensely relaxing and meditative without ever sucking the user into couch lock paralysis.

The exotic nature of Sunset Paradise is reflected in the color show that certain phenotypes will display, with a flush of reds and purples lighting up the growth cycle, while trichome luminosity and out of control resin production are key characteristics in general.

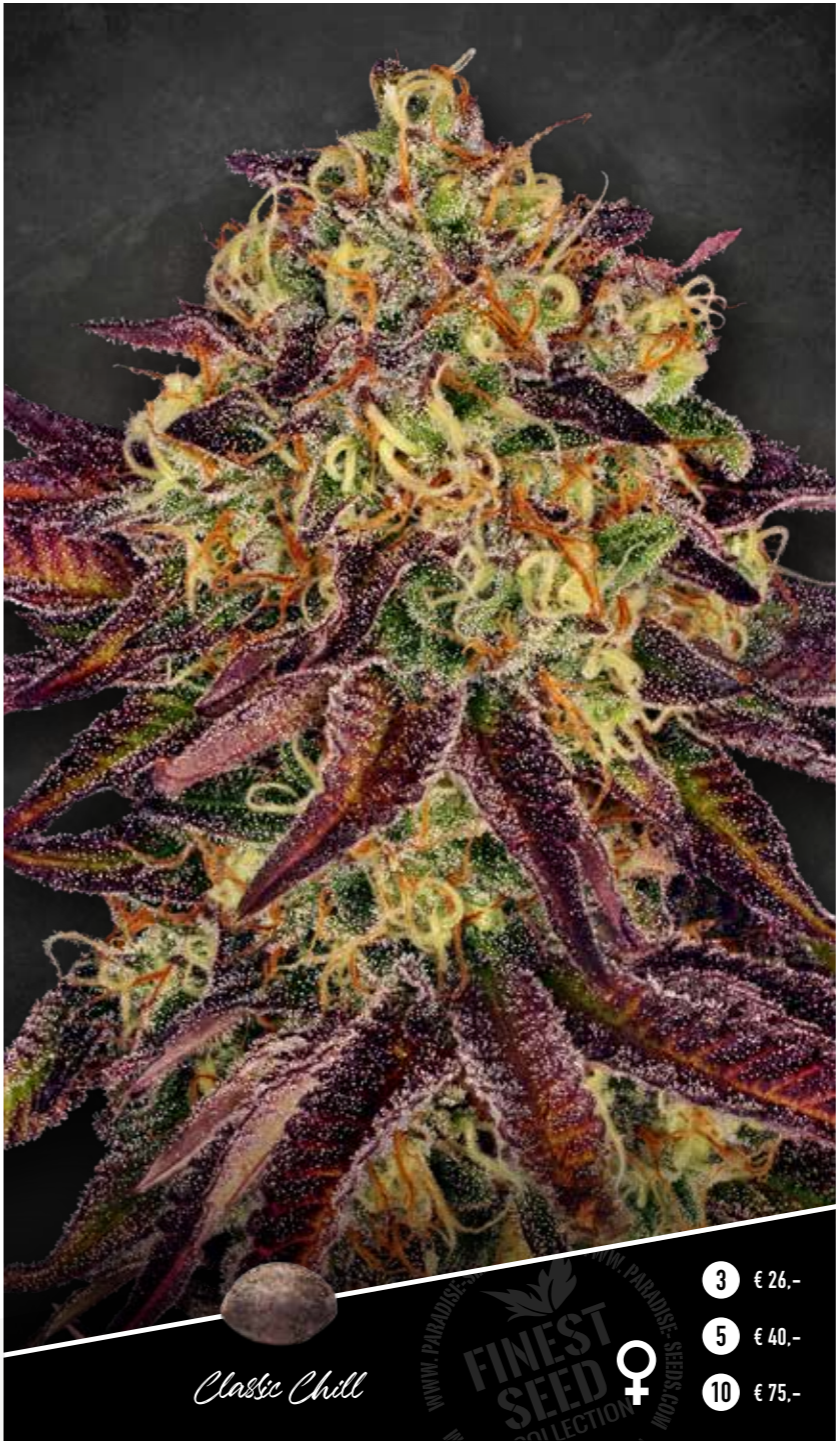

Indoors, this plant is a grow room's best friend and should not exceed a meter in height. As it flowers it produces a rich and complex aroma which is underpinned by tones of citrus, berry and lavender.

Outdoors, it will also perform well, bringing a generous scoop of Gelato to gardeners in more temperate climates. However, it is Mediterranean regions which will see the full rewards of this sun loving indica.

Suitable for growing outside between 50° n.L. and 50° s.L., Sunset Paradise will finish in early October outdoors (n.L.) and after 8 weeks indoors. Estimated yield is 450 g per m² indoors / 1000 g per plant outdoors.

Classic Chill

WWW.PARADISESEEDS.COM
FINEST SEED COLLECTION

TANGERINE SORBET®

Tangerine Sorbet is the Californian cousin of Paradise Seeds' famous Wappa strain. It's a turbo charged, big yielding, fruity flavored hybrid with an extremely high THC level.

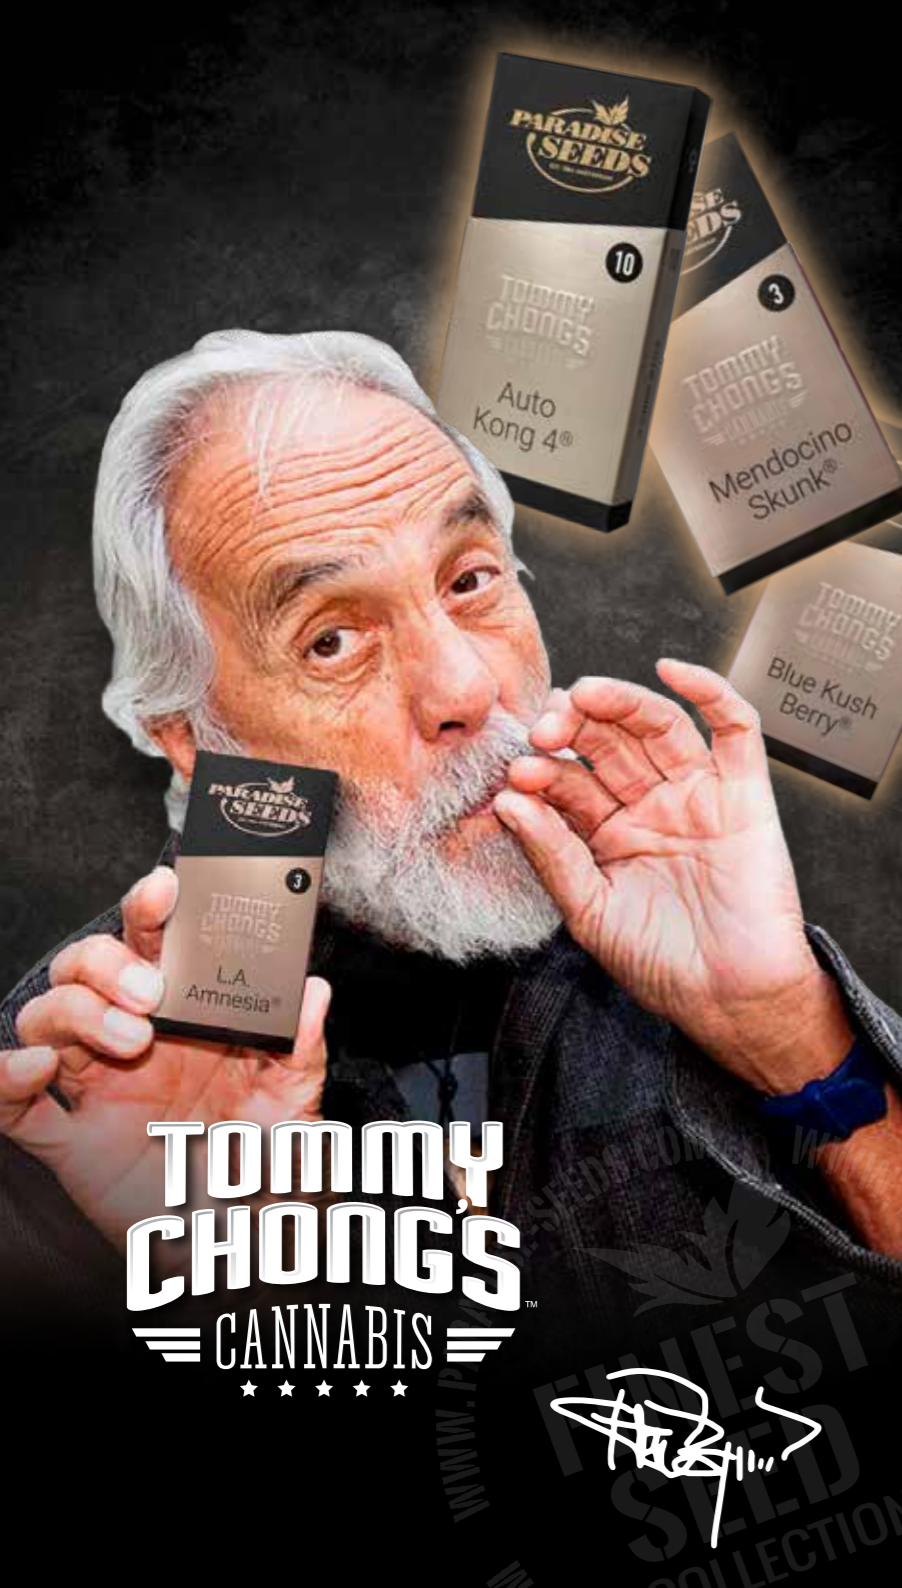

A superb addition to the Wappa crew, this plant shares some of the characteristics which have made the original so popular. At the core is Sweet Skunk but the cross with Thin Mint Cookies takes this strain to new levels of Californian infused potency (+24% THC).

The terpene profile sets tastebuds dancing with hints of sweetness and tangerine, underlined by peppery spice. Potent, strong, powerful... we really cannot emphasize this enough! Expect an instant hit of high energy and pure happiness as Tangerine Sorbet surges through the system.

Indoors, this plant continues in the tradition of Wappa. It's a superb performer in the grow room and the ultimate easy management plant which will appeal to all growing abilities. Dramatic coloring provides eye candy in the flowering stage, as does the thick trichome cover.

This strain is a great choice for the outdoor set up thanks to its no-nonsense performance. There's nothing fussy about Tangerine Sorbet and with its excellent mold and disease resistance growers in all regions will be very happy. Suitable for growing outside between 50° n.L. and 50° s.L., Tangerine Sorbet finishes at early October outdoors (n.L.), while indoor finish time is 9 weeks. Estimated yield is 650 g per m² indoors / 1000g per plant outdoors.

TOMMY CHONG'S CANNABIS = PARADISE SEEDS

Paradise Seeds is proud to work with cannabis legend, Tommy Chong, on a unique cannabis collaboration to produce the finest cannabis seeds. Tommy Chong's Cannabis fuses the best genetics of Amsterdam and California.

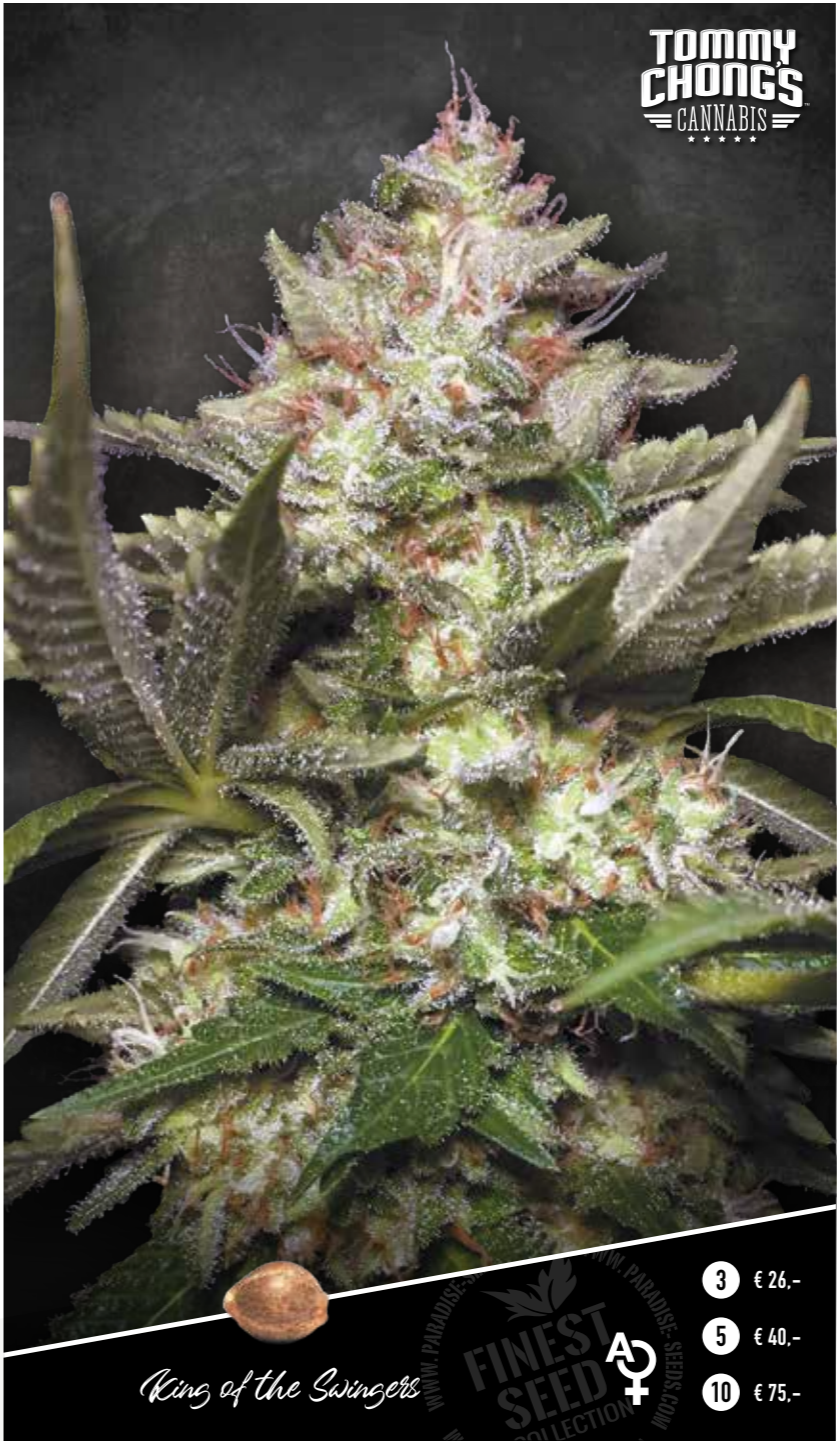

If you love cannabis then you will definitely know Tommy Chong. He is one half of one of the greatest counter cultural comedy duos of all time. Back in the day, when the marijuana plant was demonized by most sections of society, Cheech and Chong put cannabis comedy on the map with classic movies such as Up in Smoke and Nice Dreams.

Fast forward the years and now, with the legalized cannabis scene getting bigger around the world, Tommy Chong brings his lifetime's experience as America's Sweetheart of Cannabis to his celebrity cannabis brand. The company's products include a range of weed that carries his famous name.

Tommy was looking for a seed bank to work with in order to bring his name to a range of cannabis seeds and as, one of the oldest seed companies in the business, we got the call at Paradise Seeds. So it is a huge pleasure and honor for us to work with Tommy and collaborate on a new line of seeds. The Tommy Chong's Cannabis selection features a Sativa, Indica and Hybrid and Autoflower strains.

We cannot lie. When a cannabis hero like Tommy Chong asks us to develop seeds that are worthy of the title Choice of Legends, we have serious work to do! It was definitely a challenge for us at Paradise Seeds, but we have been working away in our breeding rooms and we are super pleased with the final results. Our joint collaboration is four varieties of cannabis plant which combine the genetics and flavors of California and Amsterdam.

Which variety will you choose for your set up? Four great strains to choose from... or maybe a combination of all 4! Now that really would be the Choice of Legends!

AUTO KONG 4®

Auto Kong 4 is the first autoflower to join our Tommy Chong's Cannabis collection and this hybrid combines full blooded potency with Empire State sized yields.

A Paradise Seeds spin on the tremendously potent GG4 (formerly known as Gorilla Glue), a California inspired strain endorsed by cannabis legend, Tommy Chong.

It began with an original GG4 cutting from the USA, which was backcrossed over 4 generations and combined with Pandora, our original autoflower.

Indoors, Auto Kong 4 is easy to grow and flexes very impressive muscles in the bud department, with a resin count that is off the scale.

Outdoors, it will also do well, thanks to the in-built auto high performance that comes from the Pandora element. This plant is characterized by two phenotypes; a slightly more sativa dominant type and an Indica dominant type. The indica pheno s has more sweetness to it, while the sativa pheno is characterized by a lemony/acidic fragrance and taste that is more in keeping with the traditional GG.

The effect is a mix of racing euphoria and the kind of heavy duty relaxation that made GG such a huge hit - with many medical users appreciating this effect.

Suitable for growing outside between 60° n.L. and 60° s.L., Auto Kong 4 will finish in 9 - 10 weeks after seed germination outdoors and 8 -9 weeks indoors. Estimated yield is 450 grams per m² indoors / 100 grams per plant outdoors.

60% INDICA	16-20% <0.1%	Lemon, Sweet
120 cm 450 g/m²	65 Days	120 cm 100 g/pl.

SUPPLIER OF MEDICAL CANNABIS VARIETIES!

In recent years scientific research has highlighted the effectiveness of cannabis for treating sufferers of medical conditions. This is hardly a new revelation, as the plant has been used since the dawn of time for its medicinal properties.

However, what is new is the change in attitude which is taking place across the globe. Many more medical professionals are aware of the potential benefits that cannabinoid compounds, (the active ingredients in the cannabis plant), can bring to a wide range of medical sufferers. The best known cannabinoids are THC (tetrahydrocannabinol) and CBD (cannabinol) and each has very different effects. THC is the psychoactive component of the cannabis plant, bringing the user a 'high' sensation. CBD is responsible for bringing relaxation, a sense of calm and is well documented for its pain relief properties. For this reason 'medical cannabis' strains are described as being high CBD.

Although research points to its potential as a possible cure for some conditions, cannabis is recognized primarily for its ability to treat and relieve medical symptoms. As well as its value in treating symptoms of serious illnesses such as cancer, HIV/AIDS, glaucoma and epilepsy, cannabis is regularly used to treat common complaints such as arthritis, back pain and PMS. Paradise Seeds varieties are able to help relieve pain and suffering, reduce nausea, induce appetite and treat a range of other ailments for people who require medical marijuana. For many people, cannabis is essential to making life bearable. Unfortunately, in most countries cultivation of cannabis plants, even for medicinal use, is still prohibited.

Paradise Seeds encourages patients to thoroughly research how cannabis can help their medical condition, including consulting your doctor. The evidence, in the form of scientific research and medical case studies, is widely available online. We recommend that you obtain your knowledge from reputable sources and not to believe everything you read on the internet. We also strongly advise you to research the legal status of medical cannabis cultivation in your country of residence.

MEDICAL USER PROGRAM

Are you a medical cannabis user? Paradise Seeds offers a 50% discount on all of our seeds for any person or grower's group who can prove their medical cannabis requirements.

The scheme is part of Paradise Seeds' ongoing commitment to furthering the medical cannabis cause and supporting the needs of those who need it most. Paradise Seeds founder and master breeder, Luc Krol, said: "When we launched Paradise Seeds 24 years ago, we soon became aware that patients suffering from a range of medical conditions were using cannabis to relieve their symptoms. In recent years anecdotal evidence has increasingly been supported by scientific research. Cannabis brings relief for many thousands of medical users and yet many patients still struggle to find a reliable supply of high quality cannabis.

It is time this changed, especially in the light of the continuing global legalization process. Growing medical cannabis for personal use should be a human right. This discount is a token of our belief and we hope this program will be of help to those patients who need it most."

Paradise Seeds strains are grown by companies producing medical cannabis under license from the Canadian Government and Government supported grow projects in South America. Paradise is also a main sponsor of the Medical Cannabis Bike Tour which raises money for research into cannabis as a potential cancer treatment.

HOW TO JOIN THE PROGRAM?

To qualify for the Paradise Seeds medical program, users will need to supply ID and relevant medical documentation (such as prescription, medical card or doctor's recommendation). The offer is available to those growing for personal use and is bound by national restrictions regarding the import of seeds.

For more details and to send the medical documentation we kindly ask you to contact the dedicated email address: medical@paradise-seeds.com

AUTO ACID®

Auto Acid brings the power and taste of our sativa/indica feminized Acid plant, in the form of an impressive autoflower. One of our newer generation strains, it is the Paradise Seeds take on the American classic, New York Diesel.

The flavor is unusually intense for an autoflowering variety, and has a reassuring sourness to it, in keeping with the Diesel tradition. The effect is a smiley, psychoactive buzz that borders on the trippy.

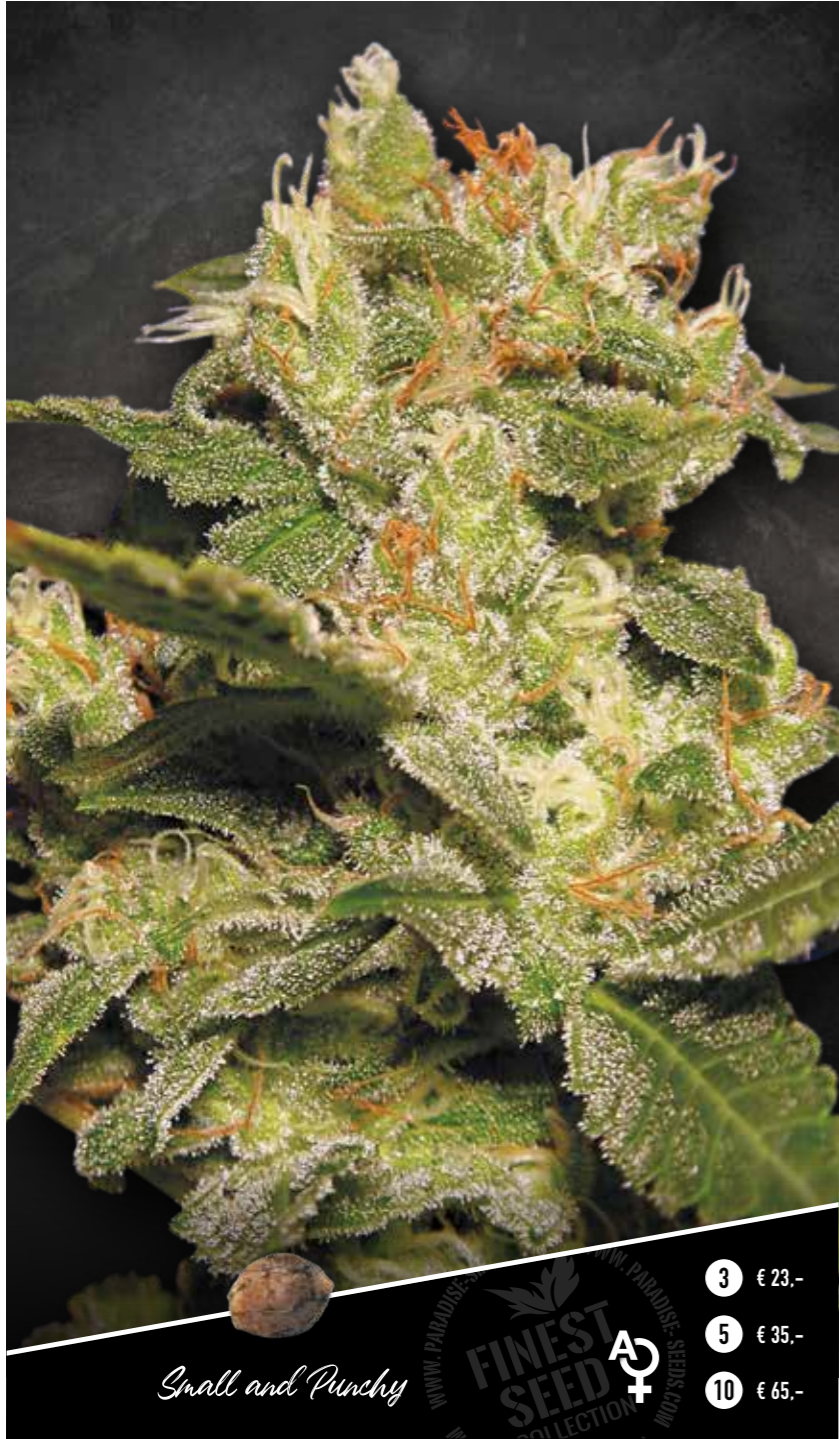

Our original Acid strain has been bred with the genes of the cannabis ruderalis, to give it a natural clock that starts ticking the moment the seed is germinated. The result is a plant that will grow just about anywhere, producing super resinous buds from a thick central cola.

Indoors, Auto Acid is ideal for any grow room mission. Due to its reduced size it can make the most of small spaces, not to mention sunny windowsills and balconies.

Outdoors, this plant is a great addition to any garden. Of course it will thrive in warmth and sun but, just like all our autos, it will produce even during a poor northern European summer, although inevitably yield will suffer from lack of decent sunshine.

Suitable for growing outside between 60° n.L. and 60° s.L., Auto Acid is ready to harvest 11 – 12 weeks after seed germination outdoors and 10 – 11 weeks indoors. Estimated yield is 400 g per m² indoors / 75 g per plant outdoors.

WWW.PARADISESEEDS.COM
FINEST SEED COLLECTION

AUTO JACK®

Auto Jack is one of our best selling autoflower varieties. It is the auto version of our Jacky White strain and supplies a super sativa kick in an easy to grow smaller version.

The taste of Auto Jack is dominated by a fruity sweetness that will make the mouth water. Its effect comes on quick, an uplifting high that puts you at ease with the world and smoothes away your troubles.

Combined with the autoflowering ruderalis gene is a fantastic genetic heritage resulting from crossing the legendary Jack Herer and White Widow strains. Auto Jack is characterized by short stout growth and a rapid flowering process, producing well formed buds that sparkle with frosty trichomes.

Indoors, this is a great plant for the grow room set up. The sativa gene ensures that there is more stretching than with some autos, but this is still a very manageable plant, ideal for small spaces, and provides a decent yield too.

Outdoors, this plant will do very nicely in the garden in most regions. Any plant that will provide a decent sativa harvest in the middle of an unsettled northern European summer deserves to be worshipped!

Suitable for growing outside between 60° n.L. and 60° s.L., Auto Jack is ready to harvest 10 – 12 weeks after seed germination outdoors and 9 – 10 weeks indoors. Estimated yield is 450 g per m² indoors / 125 g per plant outdoors.

Little Big

WWW.PARADISESEEDS.COM
FINEST SEED COLLECTION

AUTO WAPPA®

Auto Wappa is the autoflowering version of our super popular Wappa feminized variety. For a small plant this indica dominant hybrid provides a surprisingly big punch and comes with a big bud production reputation.

The taste is sweet and fruity, thanks to its sweet skunk core. The effect produced is surprisingly strong with a powerful indica influence that is relaxing but also uplifting, making this a very pleasant smoke.

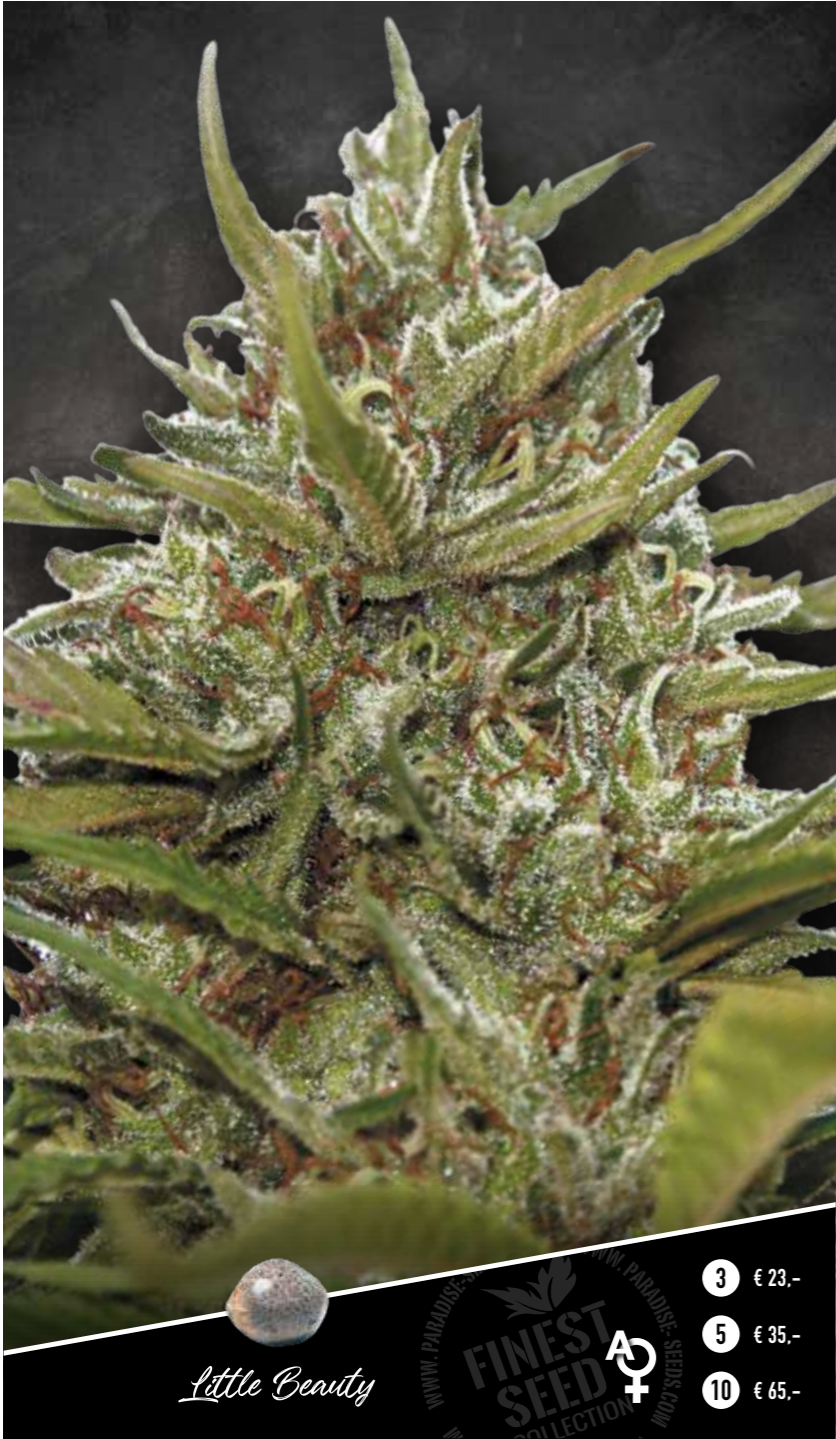

The perfect beginner's plant, Auto Wappa is a dream to cultivate which is why it is one of our best selling auto varieties. Once it blooms, it will go into hyper production mode, producing compact flowers that will deliver up a payload of big buds coated in oily resin.

Indoors, Auto Wappa will do very nicely in an indoor set up, where its stout growth and heavy fruits make it appealing to those looking for quality and yield.

Outdoors, Auto Wappa will take to any garden, and will not exceed 1 meter in height. This is also a good plant to grow as part of a stealth operation on a balcony or even in a sunny corner of your house, illustrating the great versatility of the autoflower.

Suitable for growing outside between 60° n.L. and 60° s.L., Auto Wappa will finish in 9 – 10 weeks outdoors after seed germination and 8 – 9 weeks indoors. Estimated yield is 400 g per m² indoors / 75 g per plant outdoors.

50% INDICA	14 - 18%	Fruity, Sweet
90 cm 400 g/m²	60 - 65 Days	110 cm 75 g/pl.

AUTO WHITE BERRY®

Auto White Berry is as beautiful and just as deadly as our feminized version, the only difference is that her exotic buds come from a smaller plant and automatic genes in the mix deliver a super quick finish.

This plant comes with a deliciously pungent taste, characterized by berry flavors. The 'complex' combination of high and stone makes this a smoke that will carry you through the day and then carry you to bed at the end of the night.

It is a beautiful plant to grow and potent once harvested. Auto White Berry is a sturdy plant, with buds that grow around her single cola. The buds, like an intriguing forbidden fruit, grow dense and frosty.

Indoors, its size makes it a very accommodating friend for the grow room. While the yield may not be as high as some varieties, the quality makes it the choice of the connoisseur looking for a more exotic experience.

Outdoors, this a good plant for any stealth grow, thanks to its restricted growth size and a form that easily blends into a garden background. As an outside auto this is an excellent performer.

Suitable for growing outside between 60° n.L. and 60° s.L., Auto Whiteberry will finish in 9 -10 weeks after seed germination outdoors and 8 – 9 weeks indoors. Estimated yield is 350 g per m² indoors / 75 g per plant outdoors.

 80% INDICA	 15-19%	 Berries, Pungent
 75 cm 350 g/m²	 63 Days	 90 cm 75 g/pl.

LEMONADE AUTO®

Lemonade Auto is a flavor sensation of a hybrid which combines a sweet and sour fruit bowl of citrusy terpenes with high THC levels (20%+). Leaning to the sativa side its lineage comes from Tangerine Sorbet and a sour Lemon Skunk.

This strain is all about its citrus terpene profile. The intense sweetness of tangerine is complemented by a lemon sourness, which may be more pronounced in some phenotypes. The effect is pleasantly energetic and punctuated by a sense of clarity and purposefulness.

While the flavor profile of this plant is its stand out characteristic, Lemonade Auto also arrives with decent yields and a very high potency level (20%+ THC).

Indoors, Lemonade Auto is a lovely plant to grow and it will fill the grow room with an intense citrusy aroma. Due to the sativa balance it will stretch and growers should plan for it to achieve between 1 and 1.5 meters in height. Outdoors, this plant is a great addition into any summer grow space and may even stretch a little bit more under the strength of the mid-summer sun. It's sativa nature makes it a good selection for spaces in northern regions where humidity is a factor.

Suitable for growing outside between 50° n.L. and 50° s.L., Lemonade Auto cannabis seeds produce plants that will finish in 10 - 11 weeks after seed germination and slightly less indoors. Estimated yield is 500 grams per m² indoors / 50+ grams per plant outdoors.

 60% SATIVA	 20-24%	 Sweet, Sour
 125 cm 500 g/m²	 70-77 Days	 120 cm 75 g/pl.

The Gift Giver

3 € 23,-
5 € 35,-
10 € 65,-

PANDORA AUTO®

Pandora is one of the first autoflowering strains we released, and quickly earned a reputation as being one of the best in the world. It is still an impressive indica, popular with fans of the couch and also with medical users.

The flavor is most pleasant, with a sweet and spicy taste. The ruderalis gene gives Pandora its small size but the effect is pure strong, long lasting indica. Its impressive relaxation properties persuaded us to develop this with medical cannabis users in mind.

This is a great plant to grow, so ideal for beginners, and is a heavy indica in the tradition of our Sensi Star and Spoenik #1. A compact plant, it has a high calyx-to-leaf ratio and the colas yield long compact buds that are covered with sticky crystals.

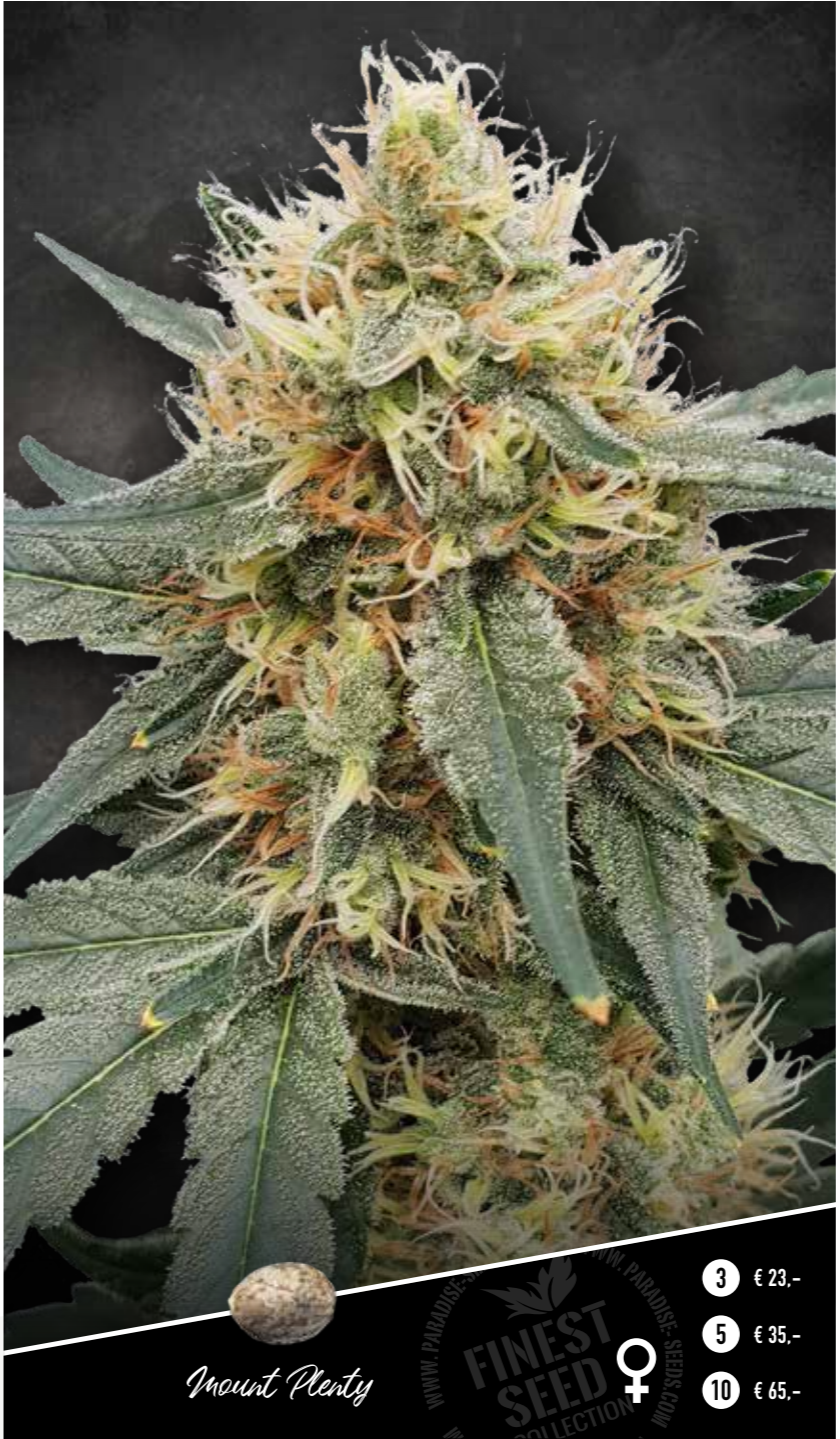

Indoors, this autoflower will grow taller than some, with a maximum height of 1.20m and will consequently gift the grower with a decent yield.

Outdoors, Pandora is a great performer in all regions, thriving in a more Mediterranean climate. but also achieving excellent results in moderate climates thanks to the ruderalis genetic clock that ticks towards flower regardless of light quality.

Suitable for growing outside between 60° n.L. and 60° s.L., Pandora will be ready to crop 10 – 11 weeks after seed germination outdoors and 8 – 9 weeks indoors. Estimated yield is 400 g per m² indoors / 100 g per plant outdoors.

Mount Plenty

3 € 23,-
5 € 35,-
10 € 65,-

STROMBOLI AUTO®

Growers looking for a potent, big yield, autoflower will be in awe of Stromboli, a volcanic mix of selected Afghani and GG4 genetics. With 20%+ THC fuelling its extraordinary power, this is an elite hybrid strain (60/40, sativa/indica) reserved for experienced consumers.

While the USP of this plant is its power and the size of its harvest, flavor fans will not be disappointed. Along with pine freshness and spicy notes, the essence of passion fruit provides taste X factor. The effect is a rush of positive energy with a rising wave of intense body relaxation.

Despite its genetics leaning to the sativa side, it's got quite a bushy structure and its impressive big buds rise from the dark green canopy like mini volcanos, characterized by crystal white surfaces, aflame with fiery orange pistils.

Indoors, Stromboli needs no special treatment and growers of all abilities will appreciate its easy management qualities. It's a good choice for those with height restrictions as this plant will not exceed 1 meter.

Outdoors, this plant is the ideal selection for an early summer big bud harvest. Its big buds also display a definite indica tendency, and for this reason growers in more humid conditions should keep a check on their development.

Stromboli Auto is suitable for growing outside between 50° n.L. and 50° s.L.. It will finish within 10 -11 weeks (slightly less for indoor grows) and the estimated yield is 550 g per m² indoors and 150 g per plant outdoors.

 60% SATIVA	 20-24%	 Pine, Fruity
 100 cm 550 g/m²	 70 - 77 Days	 110 cm 150 g/pl.

VERTIGO AUTO®

Vertigo is another of our autoflowering strains that has been bred with the medical user in mind. Its potency delivers a concentrated dose of extreme relaxation that pain sufferers will more than appreciate.

The Vertigo bouquet is intense, with a taste that fizzles with citrus. The effect is heavy, although balanced, and it's an excellent recommendation for medical users who want relief from pain without giving up on the day.

An indica dominant hybrid which grows nice and easy, Vertigo is a good plant for beginners new to growing cannabis. Its versatility also makes it popular with pros. The thick colas produce nice buds with a distinctive purple coloring and a super frosting of shiny trichomes.

Indoors, the grower will appreciate the easy growth and excellent form of this hybrid, which will stretch more than some thanks to a healthy sativa percentage in the gene pool. The yield is excellent too.

Outdoors, Vertigo will perform in all regions and has good camouflage qualities. It will naturally respond best in climates where the sun beats down, but will also rise to the challenge of moderate climates where rain and cloud are a constant feature.

Suitable for growing outside between 60° n.L. and 60° s.L., Vertigo will be ready for harvest in 9 – 10 weeks after seed germination outdoors, and 8 – 9 weeks indoors. Estimated yield is 500 g per m² indoors. 75 g per plant outdoors.

 60% INDICA	 15-19%	 Citric, Bouquet
 110 cm 500 g/m²	 60 Days	 125 cm 75 g/pl.

Sweet Lullaby

DURGA MATA II CBD®

Durga Mata II CBD is a Paradise Seeds strain that has been bred especially for medical patients. It comes with all the relaxation powers of our original Durga Mata but without the high that medical users, not used to cannabis, find uncomfortable.

The perfumed aroma and distinctive spicy taste, remains the same. However, Durga Mata II CBD has reduced levels of THC (the cannabis compound that produces the 'stoned' feeling) and enhanced levels of CBD, which brings relaxation, pain relief and a sense of well being.

Although this plant has medical users in mind, there are also users out there who just prefer the CBD effect. If that is the case, then this is the plant for you. A low maintenance strain that is ideal for beginners. Stout and bushy, its branches produce decent buds.

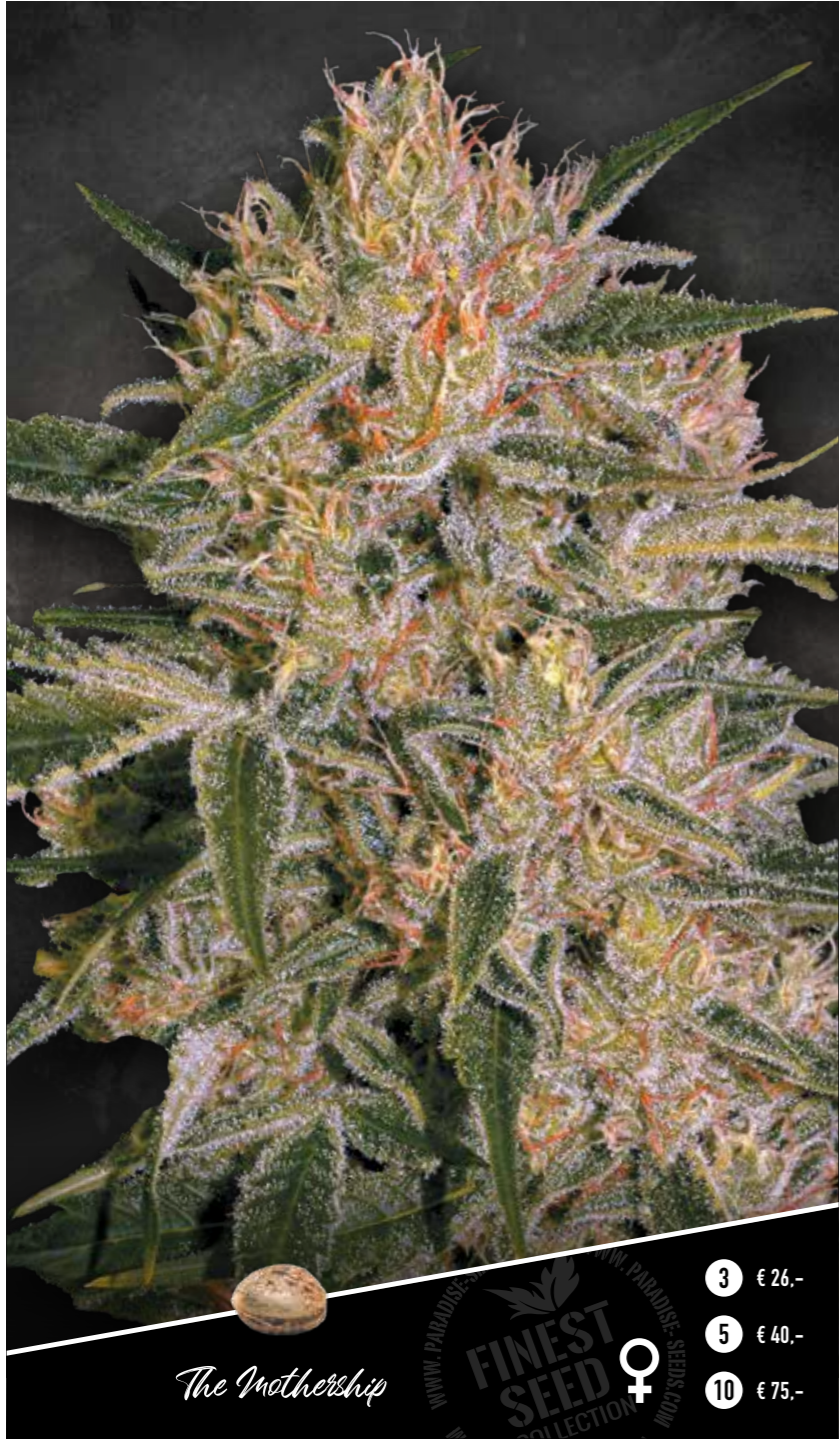

Indoors, this plant is perfect for the grow room and its size also makes it also a good companion for growers with SOG/SCROG set ups.

Outdoors, this plant thrives in warmer climates, but is also a good fit for moderate climates because it does not need so much light and has excellent pest and disease resistance.

Suitable for growing outside between 55° n.L. and 55° s.L. Durga Mata II CBD is ready to harvest at the beginning of October (n.L.) and finishes in 7 - 8 weeks indoors. Estimated yield is 400 g per m² indoors / 500 g per plant outdoors.

10 € 75,-

NEBULA II CBD®

Nebula II CBD is the CBD rich version of our award winning sativa, Nebula. It comes with all the great qualities of the original but without the stoned feeling that some medical users find uncomfortable.

This is a great tasting plant with a honey sweet and fruity flavor. As it is a CBD rich plant, it has been bred with reduced THC (the cannabis compound that gives the 'stoned' feeling) and increased CBD which, in the case of Nebula II, results in a very relaxing body sensation.

This sativa dominant hybrid does like to stretch and its moderate side branches will fill with densely packed flower, producing buds that are tight, hard and crystal coated.

Indoors, Nebula II CBD is an excellent choice for the grow room, although for best results treat this plant to lots of light. It is also very receptive to training so will fit in nicely into a SOG/SCROG set up.

Outdoors, Nebula will perform very well. It loves sun and warmth and will excel in warmer climates, however, it is also a robust and versatile plant that will prosper in more northern regions, especially in gardens that are south facing.

Suitable for growing outside between 50° n.L. and 50° s.L., Nebula II CBD will finish in early October outdoors (n.L.) and in 8 – 9 weeks indoors. Estimated yield is 450 g per m² indoors / 700 g per plant outdoors.

10 seeds package: € 50,-

HIGH CBD VARIETIES

Paradise Seeds presents its High CBD range. It features 6 distinctive High CBD varieties that contain 15 – 20% CBD and less than 1% THC. Through the Paradise Seeds breeding program they have been developed for genetic stability, result consistency and with enhanced flavonoids and terpene profiles.

One of the most notable developments in cannabis in recent years has been the incredible demand for CBD products. It wasn't that long ago that we could not write about CBD without having to ensure the customer was aware that it did not produce any of the psychoactive high associated with THC. This has changed and most consumers are now well educated to the effects of CBD.

CBD strains are popular across a range of users – medical and recreational. Not only is CBD legal in many countries, it is the cannabis strain of choice for recreational users who love the calming effect of cannabis but don't enjoy the psychoactive effect. CBD flower is now used for a range of purposes - from medical relief and relaxation, to use as a tobacco substitute.

MERCHANDISE

Paradise Seeds has a history of selling fine seeds. We also carry an exclusive range of branded clothing and accessories. Bring some Paradise into your life! We have clothing for men and women - from logo branded t-shirts and hoodies to exclusive limited edition collaborations on tee designs and caps. We also have some great accessories to enhance your smoking experience, from 2 and 4 piece grinders to specialty rolling papers and lighters.

DISCLAIMER

Paradise Seeds trades in medicinal hemp seeds. Import, export, stocking and supplying of hemp seed is exempted from regulation under the 1961 U.N. Single Convention on narcotic drugs and affiliated international treaties. In Holland, as in most European countries, it is legal to trade hemp seeds. This is clearly incorporated in the Dutch National Opium or Controlled Substances Legislation Act. Regulation and implementation regarding hemp seed differs from country to country. Trading or stocking hemp seed, or growing cannabis plants, might be prohibited in your country. Paradise Seeds advises you to take measures to inform yourself about the regulations and laws you are subject to in your country. Paradise Seeds does not condone anyone acting in conflict with their national law.

We need to point out that all those who purchase from Paradise Seeds are responsible for their own actions, at present and in the future. Paradise Seeds accepts no responsibility in this respect. Neither do we accept any product liability. If you wish to order seeds, you must be 18 years or older and accept full responsibility for your actions.

SHIPPING AND DELIVERY

INSIDE THE EU – GUARANTEED DELIVERY

We will send your order via courier delivery service, providing accurate track and trace information. Your delivery should arrive within 3 - 5 working days. We guarantee delivery only on orders within the EU. If a parcel gets lost, Paradise Seeds will replace the parcel. Your delivery will be discrete and your seeds will arrive in an unmarked envelope.

OUTSIDE THE EU

We will send your order with normal postal services. Delivery may take a bit longer, depending on the postal service in your country. We cannot guarantee delivery outside the EU, nor refund money for packages sent. For orders outside the EU you have to accept full responsibility for your order and accept that Paradise Seeds cannot be held responsible for missing items. Your delivery will be discrete and your seeds will arrive in an unmarked envelope. Please email us first to check if we can send seeds to your country. Please note that we do not send seeds to the USA.

YOUR PERSONAL DETAILS AND PRIVACY

On our website you can make a payment as a guest, or you can create an account. If you choose to pay as a guest, please fill in the necessary details. These details will not be saved. If you choose to make an account, personal details will be saved as it will make it easy for future orders - you simply login and your details will appear. You can log into your account to change your details at any time. Your details will not be given to third parties, and will only be used for your order at Paradise Seeds.
